Abstract

Multi-predicate Constructions in Nuuchahnulth

David Inman

Chair of the Supervisory Committee:

Chair Emily M. Bender

Department of Linguistics

This dissertation documents and models two types of multi-predicate constructions in Nuuchahnulth: serial verb constructions, and a construction involving a suffix called the predicate linker. I define a serial verb construction (SVC) as any clause with two verbs present and no over coordinating element. I document the circumstances under which this occurs and its grammatical constraints, and classify SVCs in Nuuchahnulth into 5 categories. I also examine the linker suffix and provide a grammatical description for it. Unlike SVCs, the linker coordinates two elements which serve as predicates in the syntax, a category which includes more than verbs. I use the properties of the linker and SVCs to shed light on words that are category-ambiguous. Finally, this is all implemented inside of a DELPH-IN style HPSG computational grammar. The analyses are implemented and tested against a set of vetted sentences illustrating the phenomena.

INTRODUCTION

Chapter 2

METHODOLOGY

This work has proceeded along two tracks. The first has been gathering primary data through field work as well as using published corpora in the language to uncover grammatical facts. The second is the implementation of the analysis of these grammatical facts through a computational syntactic framework. I will address my methods for each part of this separately.

2.1 Gathering data in Nuuchahnulth

Before I began my project on serial verbs and the linker, I first learned enough Nuuchahnulth to become at least conversant in the language. I did this by reading the published literature (especially Sapir & Swadesh 1939), attending language learning classes in Port Alberni (many of them with my colleague, Amie DeJong), and direct study with Adam Werle, some of which was funded through summer Foreign Language Acquisition Scholarships (FLAS). The language lessons I participated in were taught by Adam Werle and often included elders and native speakers who would assist, correct, and aid in teaching. It was through this venue that I first met fluent Nuuchahnulth elders.

In the summer of 2016, Adam and I traveled to Hot Springs Cove and collected texts from some Hesquiaht elders. On request, that data is not presented in this dissertation, but some of that work has informed my analysis, which I have confirmed with other speakers.

2.2 Data sources

I began learning and working with Nuuchahnulth at the start of 2015. Before I collected my own data, I looked at data from a variety of sources to generate appropriate questions. My sources were previous syntactic work on the language, especially Jacobsen (1993), Nakayama (2001), Wojdak (2003), Waldie (2004), and Woo (2007). I also relied on corpora published by linguists, especially the Nootka Texts

(Sapir 1924; Sapir & Swadesh 1939, 1955; Sapir et al. 2000, 2004, 2009). Matthew Davidson has digitized two of these volumes (Sapir & Swadesh 1939, 1955) and has provided me access to it. Without this work, searching through the texts for grammatical constructions would have been much harder.

In addition to these resources, I looked at community-produced texts such as “Son of Thunderbird” and texts I received from linguists Adam Werle and Henry Kammler. The largest of these were an in-progress Bible translation Adam Werle and Sophie Billy were working on and several recordings Henry Kammler made with the late Barbara Touchie. I looked through these sources for examples of the phenomena I was looking for, annotated and cataloged them, and used some of these examples as prompts for speakers.

2.3 *Elicitation methods*

I spent January, February, and part of March of 2018 in Port Alberni working with native speakers and gathering data specifically for this dissertation. In that period of time I worked with Julia Lucas (Nuuchahnulth name *tupaat*, Ahousaht tribe, central dialect), Bob Mundy (Uclueleht tribe, Barkley Sound dialect), Marjorie Touchie (Uclueleht tribe, Barkley Sound dialect), Fidelia Haiyupis (Ehattesaht tribe, northern dialect), and Sophie Billy (Checkleseht, Kyuquot-Checkleseht dialect). I also present data I gathered earlier from Simon Lucas (Nuuchahnulth name *yuutnaak*, Heshquiaht tribe, northern dialect), the late husband of Julia Lucas. I later spent much of March and April of 2019 in Ucluelet, working with the same speakers, and some of this work was in tandem with work carried out by the First Nations Education Foundation.

I have made an effort to make my work, especially my recordings and transcriptions, available to the communities I have worked with. Some of my work with Fidelia Haiyupis and Sophie Billy was funded by the Ehattesaht tribe, which has received copies of my notes and recordings. The Uclueleht band office has received the notes and recordings I made with Bob Mundy and Marjorie Touchie. I have also made recordings and transcriptions available online to language learners. Some of this information is restricted to people who have the right password to access the folder. I take precautions not to collect data that is sensitive to audience restrictions, and so for most of these materials, password-restricted access is not done out of a concern with rights management, but with the fact that many of these materials are

works in progress and I do not want possibly-inaccurate transcriptions to be disseminated widely among people who are lower-level language learners.

When working with speakers, I tended to work two to four hours at a time and tried to structure sections in three parts: grammatical questions and elicitations, vocabulary questions and clarification questions on existing texts, and text elicitation. The purpose of this was to avoid wearing speakers out with too many grammatical questions in a row, and to collect other important data. While there has been good primary linguistic documentation in Nuuchahnulth, particularly in Sapir & Swadesh (1939) and Rose (1981), there are many differences across the language's wide spread of dialects that remain undocumented and unknown. Although one of my speakers did not like giving lengthy texts, I was able to collect connected, fluent texts from all other speakers, which is a lasting artifact and can be used to answer questions beyond the scope of my dissertation. In total, I have about seven hours of recordings from my field work, about three hours of which are texts that are continuous or mostly continuous Nuuchahnulth.

None of the below methods worked all of the time. Anecdotally, I found that staying in Nuuchahnulth for longer periods of time helped more than anything else, although this was quite difficult to do.

2.4 *Methods of Elicitation*

I used eight methods of elicitation, the aim of all which was to obtain the most natural Nuuchahnulth examples or grammatical judgments that are relevant to the phenomenon under investigation. Some methods worked better than others. Only one of my consultants was literate in the language, and while she would correct my pronunciation sometimes by writing out a word, she preferred to work in an oral environment and have me read my notes back to her. As a rule, these elicitation sessions occurred in either a completely or nearly-completely oral context. All Nuuchahnulth speakers I worked with were bilingual in English.

2.4.1 *Describing Images*

The aim of this methodology is to avoid the metalanguage (English) through the visual medium. The speaker is presented with a series of images and asked to describe what is going on using only Nuuchah-

nulth. One set I used was a series of photos of dogs at a reserve. The dogs are standing at a pier. They begin barking at the water. A boat approaches the pier. The dogs go up to meet the man in the boat, who pets them. The purpose of this was to elicit a few serial verb constructions, the equivalent of “The dogs are at the wharf” (locations are verbs in Nuuchahnulth), and “The man pilots the boat to the dock” (which would require two verbs). In addition to photo series, I also used hand-drawn pictures on index cards, and existing picture-story books.

I found this method occasionally fruitful but limiting. Sometimes (especially with my hand-drawn cards), speakers would spend a lot of time questioning what the picture was meant to represent. Even with photos, they wanted to know what to focus on: Who is the man in the photo, and who is he related to? While broad grammatical structures could be gathered this way, other methods were more fruitful for eliciting targeted phenomena.

2.4.2 *Answering Questions*

Another way of getting natural speech is by asking questions to elicit the phenomenon. In this method, I would tell a short story and ask a question about what happened. I hoped elicit a response that used the grammatical phenomenon I was investigating.

For instance, one of my setups was the following (spoken in Nuuchahnulth): “I saw two creatures come out of the forest. One was a dog, one was a wolf. The dog approached me. The other went back into the forest. He ran. It was the dog that approached me. What did the wolf do?”

The expected answer is “The wolf ran into the forest,” which requires coordinating the two verbs ‘run’ and ‘into the forest.’ I had very low success rates with this kind of elicitation and quickly abandoned it. Speakers would select the most semantically salient verb, in this case ‘into the forest,’ and drop the other verb in the construction. For instance, one response I got to this prompt was (1)

(1) hitaaq^hiʔa^h q^wayačiik.

hitaaq^hi^hλ=!^ha^h q^wayačiik

in.forest.MO=NOW wolf

‘The wolf went into the forest.’ (N, Fidelia Haiyupis)

I had similar issues with other question-answering. Speakers preferred to answer as succinctly as possible, which was not useful for the phenomena I was investigating. There may be a more fruitful way of using this kind of elicitation method, but I was unable to find it.

2.4.3 *Recording Texts*

My fieldwork also involved recording fluent texts from Nuuchahnulth speakers. This work is a valuable endeavor in itself, but it also allows speakers to give examples of these phenomena in a fluent context. Both linker and serial verb constructions occur naturally in running texts, and in the relevant chapters I will give counts of grammatical phenomena in texts I collected as well as some historical texts.

2.4.4 *Rephrasing Stories*

The typical person is interested in language as a means of communication and not a set of abstract grammatical rules. Rephrasing traditional stories or short narratives is one way of trying to get natural versions of grammatical phenomena, especially if the original requires them. I tried three forms of retelling: (1) asking a speaker to summarize in a few sentences a text I had previously gotten from them; (2) asking a speaker to summarize my own story; (3) asking a speaker to retell a traditional story they know.

I did not have good results with (3), but I did better with (1) and (2). Not every consultant I worked with had the patience to resummarize their own text, but those that did could be persuaded to give a few-sentence quick summary. For retelling my own stories, I quickly found that the best way to do this when I gave a succinct story in English and asked for a retelling in Nuuchahnulth. For example, “I like to walk in the forest in the mornings. There are lots of bluejays in the forest. They must like me, because they follow me around the forest.” The first sentence has the opportunity for three verbal expressions in a sentence: location, action, and time. The final sentence also has the possibility for a serial verb construction: a location and an action.

2.4.5 Forced Choice

Forced choice gives the speaker a few examples to choose from when trying to select the best way to describe something. This strategy was a mixed bag. Very frequently speakers would reject both, or offer a third way of saying it and refuse to choose between those presented. On the other hand, giving speakers a limited set of choices sometimes led them to describe what made one or all sentences bad, for example “It could mean something else.” Speakers would more frequently volunteer reasons why a sentence is bad if there were other options present, or if all options were bad.

One case where I used this was a situation where I am spending time with someone and I am clearly tired. I have a new baby, and I want to explain that the baby kept me up all night. The options were:

- (2) ? ʔuusaahimta naʔaqakʔi wikitaḥ ʔuʔ weʔič.

ʔuusaahi=(m)it=maʔ naʔaqak=ʔiʔ wik=(m)it=(m)aʔḥ ʔuʔ weʔič

because.of=PST=REAL.3 baby=ART NEG=PST=REAL.1SG good sleep

? ‘I didn’t sleep well because of the baby.’

- (3) ? ʔuusaahiqḥita naʔaqakʔi wikitaḥ ʔuʔ weʔič.

ʔuusaahi-(q)ḥ=(m)it=maʔ naʔaqak=ʔiʔ wik=(m)it=(m)aʔḥ ʔuʔ weʔič

because.of-LINK=PST=REAL.3 baby=ART NEG=PST=REAL.1SG good sleep

? ‘I didn’t sleep well because of the baby.’

In this case, my consultant Bob Mundy strongly rejected (3), and this helped me understand how the because words interacted with the linker morpheme.

I also attempted to put together a list of standard sentences testing for ordering preferences. I presented the below to Checlesht speaker Sophie Billy.

- (4) mamuukwitsin hiʔ maatmaas.

mamuuk-wits=(y)in hiʔ maatmaas

work-going.to=WEAK.1PL be.at house.PL

? ‘We will work at Mahtmahs.’

(5) hiłwĩtsin maatmaas mamuuk.

hił-wĩts=(y)in maatmaas mamuuk

be.at-going.to=WEAK.1PL work house.PL

? ‘We will work at Mahtmahs.’

Sophie Billy preferred (5). I believe both utterances are grammatical, but there is an overall preference to express locations first. I will go into more depth about this preference in §4.

2.4.6 *Translation*

I also used translation from English, which I consider a less preferable form of elicitation due to the possibility that the speaker will adopt English-like syntactic structures instead of Nuuchahnulth-like structures. However, some speakers were most comfortable with this kind of elicitation task, and it is easier to do. With one speaker, we worked slowly over a couple of sessions through an abridged translation of *The Little Prince*.

There were other, shorter versions of this kind of elicitation. For instance, “We are going to go camping. I want the children to help their mother. I want them to pack. I want them to carry the luggage. What should I tell them?” The purpose of this was to get a command form, which is always marked with overt second position inflection, with a serialized verb construction where the verbs must necessarily share the command mood. The construction would minimally have two sequential verbs and perhaps the benefactive verb to express “for your mother.”

2.4.7 *Grammatical judgments*

It is a cultural Nuuchahnulth value not to overtly correct people, and especially not to do so in public. While this is perhaps a good cultural practice for creating a healthy community, it is bad for linguists trying to learn what is and is not grammatical in a language.

Straight grammatical judgments—is this utterance a part of the language or not—are necessary in linguistic descriptions. These are also necessarily linguist-constructed, so I would put together a sentence, and ask about it. In my first few attempts, speakers would typically respond with “I suppose you

could say it that way,” or “I understand you.” Even asking “Would you say that?” or “Am I saying it correctly?” speakers are typically hesitant to offer a correction unless the sentence was completely unintelligible.

The way I attempted to get around this was by asking speakers if what I said sounded like their dialect, like something they might say, and if they could repeat it. If a speaker consistently would rephrase the utterance when repeating it, I took it to mean that my version was likely ungrammatical. If I gave an example sentence out of the blue, I tried to provide context. I often have the best success with getting clear judgments by rephrasing speaker utterances when we were working on something else. I would add, remove, or move an element, and sometimes change the setup. Speakers were much more willing to give a firm yes or no in this context.

2.4.8 *Constructing a sentence*

There were many instances where I would ask speakers, “Can you think of a case where you would use this word?” I constructed this method on the fly, as speakers would reject examples I thought were grammatical, or I could not come up with a context that would elicit the construction I was looking for. In most of these cases, I was trying to get an example of a word with a linker morpheme attached (§5).

2.5 *Data Collation*

I collated the examples of the grammatical phenomena I was interested in. These came from a set of stories I had previously interlinearized, from a subset of Nootka Texts stories I was familiar with, from my elicitation sessions with consultants, and from my transcriptions of elicited texts. I entered these examples into a spreadsheet that was tagged with the phenomenon that the example illustrated, and used this to help me find patterns in the grammatical data. To port this data to a test suite that the implemented grammar can run on, I simply had run a script that would generate a format readable by the implemented grammar (see §2.6).

2.6 Implementation through the DELPH-IN framework

My grammatical analysis has been through the DELPH-IN¹ framework, which is a computationally-implemented formalism of Head-driven Phrase Structure Grammar (HPSG, Pollard & Sag 1994) using Minimal Recursion Semantics (MRS, Copestake et al. 2005). My implementation is built on a base that uses the Grammar Matrix (Bender et al. 2002; Flickinger & Bender 2003; Bender et al. 2010).

My first step in the grammar development was to answer a questionnaire on the Grammar Matrix webpage, which generates a baseline grammar in the form of text files in the type description language (TDL). TDL is a series of declarative statements that describe grammatical rules, and the Grammar Matrix is a database of common grammatical rules across the world's languages. For instance, below I replicate a part of the TDL that describes the basic form of a head-complement rule.

```
basic-head-comp-phrase := head-valence-phrase & head-compositional &
    binary-headed-phrase &
[ SYNSEM phr-synsem-min &
    [ LOCAL.CAT [ VAL [ SUBJ #subj,
                        SPEC #spec,
                        SPR #spr ],
                    POSTHEAD #ph,
                    HC-LIGHT #light ],
      LIGHT #light ],
  HEAD-DTR.SYNSEM [ LOCAL.CAT [ VAL [ SUBJ #subj,
                                        SPEC #spec,
                                        SPR #spr ],
                                HC-LIGHT #light,
                                POSTHEAD #ph ]],
  NON-HEAD-DTR.SYNSEM canonical-synsem ].
```

¹<http://www.delph-in.net>

This rule first states that head-complement rules inherit all the constraints of head-valence-phrase, head-compositional, and binary-headed-phrase. I will gloss over what is present in these rules. Then this rule adds to the constraints of the rules it inherits from, stating that, minus the COMPS list (where complements are stored), the mother node inherits the valence and CAT (category) values of its head-daughter. The non-head-daughter is specified only to be some kind syntactic-semantic item. A further rule, the basic-head-1st-comp-phrase, inherits from the basic-head-comp-phrase and specifies what happens to the head-daughter's complements.

```
basic-head-1st-comp-phrase := basic-head-comp-phrase &
[ SYNSEM.LOCAL.CAT.VAL.COMPS #comps,
  HEAD-DTR.SYNSEM.LOCAL.CAT.VAL.COMPS < #synsem . #comps >,
  NON-HEAD-DTR.SYNSEM #synsem ] .
```

This code states that the non-head-daughter is identified with whatever the first thing is on the head-daughter's complements list, and the mother node's complements list is reduced by one. In the case where the head-daughter only has a complements list with one item on it, the value #comps above will be a null element, and the mother node will have an empty comps list. This means that the parent node is no longer looking for any complements. This process is called cancellation, and is how HPSG keeps track of the saturation of a verb's argument structure.

All of the above rule specifications are from the Grammar Matrix, and part of the provided analyses when the system generates an output grammar based on a user's answer to questions. So far, the basic-head-1st-comp-phrase says nothing about whether the head or non-head appears first. In my generated grammar, I have a head-comp-phrase that inherits from both the basic-head-1st-comp-phrase above, as well as the head-initial constraint, which simply says that the head is the leftmost element in the structure. Together with a few other constraints, this defines the basic head-complement rule in my Nuuchahnulth grammar.

Once this output from the Grammar Matrix was generated, I could then develop my own, more complex syntactic analyses. For instance, I added the below rule which allows for a dropped subject:

```
nuk-head-opt-subj-phrase := decl-head-opt-subj-phrase &
```

```
[ HEAD-DTR.SYNSEM [ LOCAL.CAT [ HEAD [ FORM finite,
                                AUX + ] ,
                                VAL.SUBJ < synsem-min > ] ,
  NON-LOCAL.SLASH < ! !> ] ] .
```

This rule inherits from the `decl-head-opt-subj-phrase` rule in the Grammar Matrix. It further specifies that the node having its subject dropped (the head daughter) needs to be finite, an auxiliary (which in my grammar means headed by a second position enclitic, §3.1.3), and that it has no gapped elements (an empty SLASH list). This rule definition is not generated by the Grammar Matrix.

I have limited the scope of my work in two major ways. Firstly, I am not modeling the morphophonology. There are two reasons for this. Morphophonology is theoretically separate from morphosyntax, and as a result of that assumption the DELPH-IN toolsets are focused on the morphosyntax. Because this is a project modeling multi-predicate constructions, the morphophonology is also not the most relevant component of the grammar. What this means is that a sentence like *ʔuumaćukʷaʕah ʔuʔušin* ‘I am going to talk about Raven’ is represented in my grammar in its already-segmented form, “ʔu-L.maćuk =!aʕ=(m)aʕ ʔuʔušin.”

Secondly, I am not separating dialect features into different grammatical models. My data comes from many different dialects of Nuuchahnulth, which each have different morphemes and slightly different grammatical rules. In my grammar’s lexicon, I have simply entered all dialect variations. This means that on generation, the grammar is happy to mismatch morphology from different dialects, which is an overgeneration. A larger project would catalog this information by dialect in a larger metagrammar which could then produce separate grammars targeting each dialect. While worthwhile, this project was set aside so I could focus on the multi-predicate constructions.

Development was done against multiple test suites of example sentences, which included both grammatical and ungrammatical examples. The three test suites I used are: (1) a basic test suite for basic grammatical sentences; (2) a test suite of serial verbs and linker constructions; (3) a test suite of example sentences that appear in this dissertation. For the first test suite, basic components of the grammar, I used simple example sentences from stories, sessions with consultants, and sentences whose grammat-

icality or ungrammaticality I was very confident about. In the end, a lot of this test suite was sentences that I created. For the second test suite, the phenomena under investigation in this document, I used only grammatical examples from my elicitation and corpora work, and ungrammatical examples from my elicitation sessions. These came from my collated data (§2.5). All test suites were loaded into a `[incr tsdb()]` database (Oepen 2001). This test suite of sentences could be run against each version of the implemented grammar and checked for changes to the parse coverage. Beyond parsing/not-parsing, each example sentence was tested for semantic faithfulness. Semantic validation had to be done manually, but regression tests allowed for parsing results to be compared with previous iterations of the grammar rather than independently reverified every time the grammar changed.

I have focused on the parsing component of the grammar. Future work will involve focusing on generation, for which the grammatical tool sets I have used are descriptively adequate. The challenges here involve restricting dialect variation, as mentioned above, as well as restricting certain second position elements which may recurse (an issue explored in more depth in Bender 2010). These issues do not affect the descriptive validity of the analyses presented here.

The result of the implemented grammar is a series of files that detail the grammatical rules, the lexicon, and rules for generation. The format for most of these files is TDL, which is a series of grammatical descriptions which are equivalent to HPSG attribute-value matrices. The regression tests in `[incr tsdb()]` (Oepen 2001) are also outputted to readable databases which show the resulting coverage of the grammar run over test cases. All of these materials are available at <https://bitbucket.org/davinman/nuuchahnulth-grammar/>.

Chapter 3

THE BASIC CLAUSE

Before addressing the main theme of this dissertation, the multi-predicate constructions present in Nuuchahnulth, I will first give an overview of the language's basic clause structure and define some important terminology and lexical and syntactic distinctions present in the language. As with the following chapters, I will first give the data (§3.1), followed by my HPSG analysis (§3.2). I will begin with the predicate/participant distinction (§3.1.1, §3.1.2), an important syntactic split which roughly maps to how verbs and nouns are used in English, but subsumes many lexical categories in Nuuchahnulth. I will then give my understanding of the second-position clausal enclitics (§3.1.3), followed by another set of second position elements traditionally understood to be suffixes (§3.1.4). Finally I will give an overview of the aspectual system (§3.1.5). In the HPSG analysis, I will give my implementation for these in the same order: the predicate/participant distinction (§3.2.1), the clausal second position elements (§3.2.2), suffixing second position (§3.2.3), and aspect (§3.2.4).

3.1 *Data*

3.1.1 *Syntactic Predicates*

Like many languages of the Pacific Northwest, Nuuchahnulth is predicate-initial and has a great deal of flexibility with respect to what parts of speech can be used predicatively (Jacobsen 1979). Because the term “predicate” and its associated derivations (“predicative” and so on) are often ambiguous between syntactic and semantic concepts, I have found that linguists often talk past each other when trying to describe the syntax of South Wakashan languages. Throughout this work I will use special vocabulary in an attempt to reduce this confusion.

I will reserve the word *predicate* to refer to the syntactic component that provides the main semantic relation of a clause and connects elements like subject and object to one another. In English, a syntactic

predicate must be verbal, as in (6,7). The verb ‘barks’ serves as the predicate of (6), and has ‘the dog’ as its subject. In (7), ‘is’ serves as the predicate, connecting its subject ‘the grass’ to the complement ‘green.’ I will refer to the units that predicates connect as *participants*—this term encompasses both subject and complements. The sole participant of (6) is ‘the dog,’ and the participants of (7) are ‘the grass’ and ‘green.’

(6) [The dog]_{participant} [barks]_{predicate}.

(7) [The grass]_{participant} [is]_{predicate} [green]_{participant}.

In contrast to *predicate* and *participant*, which are syntactic concepts, I will use *relation* and *argument* to refer to their correlates in compositional semantics. The *relation* is the atomic semantic unit that relates arguments to each other, typically represented with capital letters. For example, in (6), the English word *barks* has the relation BARK. Every semantically contentful morpheme has a relation, including syntactic participants (DOG, GRASS, GREEN).

Relations have some number of semantic *arguments*. For example, BARK can be modeled with two arguments: the event of barking, and the barker. This could be represented in a Neodavidsonian manner as BARK(e, x). Note that the relation itself BARK is at least conceptually separate from the number and type of its arguments. When I find it important to highlight the separation between the semantic relation and the number of its arguments, I may also refer to the relation as a *predicate symbol*.¹ This semantic scheme is a simplification of the fuller semantic model that I will use later, Minimal Recursion Semantics (Copestake et al. 2005).

The number of arguments that a semantic relation has is separate from its syntactic properties. The English predicate *barks* may be represented as a semantic relation with two arguments BARK(e, x). However, the syntactic non-predicate *green* can be modeled in the same way: GREEN(e, x). The syntactic properties of *barks* and *green*—predicate vs participant, which in English is straightforwardly subsumed into the verb vs adjective distinction—is separable from their semantic properties.

Though Nuuchahnulth has syntactic categories like verb, noun, and adjective, any of these may function as syntactic predicate or participant depending on where they fall in the sentence. The terms “verb

¹From terminology used by the DELPH-IN consortium. <http://moin.delph-in.net/ErgSemantics/Basics>

phrase,” “noun phrase,” and “adjective phrase” are valid insofar as they refer to a phrase headed by a verb, noun, or adjective, but they are not illuminating for determining syntactic roles, as any of these categories may be predicates.

In (8), the verb *naacsiičiči* ‘see’ is serving as the clausal predicate, while the clause *hałmiiḥa quuʔas* ‘drowning person’ is serving as the participant. In (9), the adjective *qʷačat* ‘beautiful’ is the predicate of the sentence, while the noun *ḥaakʷaał* ‘young girl’ is the participant. In (10) the noun *pisatuwił* ‘gym’ is the predicate and there are no participants. In this case, postposed *ʔaanaḥi* ‘only’ is a predicate-modifying adverb and not fulfilling any argument role of the relation GYM.

- (8) *naacsiičičiʔiš hałmiiḥa quuʔas.*

- (10) *pisatuwiłma ʔaanaḥi.*

pisatuwił=maʔ ʔaanaḥi

gym=REAL.3 only

‘It’s only a gym.’ (B, Marjorie Touchie)

Descriptively, it is sufficient to say that nouns, verbs, and adjectives may all be clausal predicates in Nuuchahnulth, in the same way that English requires clausal predicates to be verbs. I believe that this data, along with evidence from participant clauses (§3.1.2), is sufficient to claim that nouns are events in Nuuchahnulth (Inman 2018). I will give my method for modeling this in (§3.2.1).

3.1.2 Syntactic Participants

Just as verbs, nouns, and adjectives may all be predicates, they may also all be participants. Example (9) showed a straightforwardly nominal participant, the noun and article *haak^waaλi* ‘the young girl.’ However, verbs (11) and adjectives (12) may also serve as participants.

(11) ʔuhʔiiš ʔihak kamatqukʔi.

ʔuh=ʔi·š ʔihak kamatq-uk=ʔi·

wik=ʔi·č=ʔaaʔ ʔiixćus ʔaʔuu=ʔi·

NEG=CMMD.2PL=HABIT laugh.at.DR other.PL=ART

‘Don’t laugh at others.’ (C, *tupaat* Julia Lucas)

As detailed in Jacobsen (1979) and Wojdak (2001), when an adjective or verb is used as a participant, as in (11, 12), the article =ʔi· is required to make the sentence grammatical. When the participant is headed by a common noun, as in (8), the article is optional. Proper nouns differentiate themselves from common nouns in that they may never take the article (Inman 2018). They are also never in predicate position.

My analysis of these facts is that the article =ʔi· is in fact a relativizer that creates a participant from a notional predicate Inman (2018).² Noun phrases may be relativized without the article, but other predicate phrases must be headed by the relativizing second position article =ʔi·. That is, the semantics of the verb *kamatquk* ‘run’ and the noun *pisatuwiʔ* ‘gym’ look like:

(13) RUN(*e*, *x*)

GYM(*e*, *x*)

²This ultimately is original to Werle, *p.c.*, who has also documented that =ʔi· is morphologically in the same position as mood portmanteaus, and has supplanted the third person definite mood in some dialects.

The event variable *e* allows for tense, aspect, mood, and evidentiality values (TAME). This *e* is also necessary for adverbial modification, which both verbs and nouns can undergo. However, when either type of word is used as a participant in the syntax, it is the variable (*x*) that is needed by the semantics. *=ʔiʔ* provides the relativizing function to accomplish this for all predicate types, and common nouns may undergo this process without an overt *=ʔiʔ* attached. The analytical mechanisms for this will be addressed more fully in §3.2.1. Here, it is enough to say that verbs, adjectives, and common nouns are all semantically eventive. The predicate/participant distinction in the syntax reflects the accessibility of the event variable: syntactic predicates may have their event accessed and modified, while syntactic participants may not.

There is a strong tendency in Nuuchahnulth for each clause to have one overtly-expressed participant (Rose 1981:38) but if there are two participants expressed, they can come in any order. There is a preference in the southernmost dialects (Barkley sound and Central) for VSO ordering (Jacobsen 1993:267), and a preference in the northern dialects (Northern and Kyuquot) for VOS ordering (Werle, *p.c.*). This preference is not absolute, and to make the sentence unambiguous, speakers can use *ʔuukʷit* to mark any non-highest argument (Woo 2007).

3.1.2.1 Participant Fronting

It is possible for speakers to move a participant in front of the predicate for focus, as in (14). This left-dislocated participant is notably outside the calculation for second position inflection (§3.1.3).

- (14) ʔaaq ʔuʔaatamin, waaʔaʔweʔin quʔuʔsin.
 ʔaaq ʔu-ʔaʔta=(m)in waa=!aʔ=weʔin quʔuʔsin
 oil x-lack=REAL.1PL say=NOW=HRSY.3 raven
 ‘“We need *oil*,” said Raven.’ (B, Marjorie Touchie)

Wh-words and phrases also front, obligatorily, as in (15). In this case, the second position enclitics attach to the wh-word, so this fronting is “inside” the second position calculation.

- (15) quṁaačṁnik hiṁ čuumaṁaas.

quṁaa-čṁṁ=nik hiṁ čuumaṁaas
 how.many-day=PST.QUES.2SG be.at Port.Alberni

‘How many days were you in Port Alberni?’ (Q, Sophie Billy)

It is not only wh-words that front in this manner. Quantifiers tend to front as well. In the case where the fronted quantifier is part of a larger syntactic unit (for instance, as an participant of the non-highest-argument marker *-L.(č)it*), the entire phrase is fronted along with the quantifier (16, 17). In cases where a non-nominal phrase is fronted like this, it cannot appear outside the clausal clitics (18).

- (16) haṁukquuṁaala ṁuušṁ haṁum.

haṁuk=quu=ṁaala ṁuuš-L.(č)ṁ haṁum

ṁuuš-L.(č)ṁ haṁuk=quu=ṁaala
 some-DO.TO eat.DR=PSSB.3=HABIT

Intended: ‘He would only eat some things.’ (B, Bob Mundy, Marjorie Touchie)

When the quantifier fronts without the enclitic complex, its interpretation is as a bare nominal (19).

(19) ʔuuš ńaacsamitsǵa hiłqḥ ńačiqs.

ʔuuš ńaacs=(m)it=s=ǵa· hił-(q)ḥ ńačiqs

some see.CV=PST=STRG.1SG=also be.at-LINK Tofino

‘I also saw some at Tofino.’ (C, *tupaat* Julia Lucas)

My analysis of these facts is to describe two types of fronting: (i) focus-fronting of participant nominals, which falls outside the calculation for second position enclitics and adds focus information to a word; and (ii) non-focus quantifier fronting, which falls inside the second position calculation, does not add focus, and fronts the entire phrase with the quantifier (here, the phrase headed by object-marking *-L.(č)it*). Non-focus fronting does not mean that the word is necessarily not focused, only that its left-extracted position is not giving it focus. This is significant as, according to many analyses, wh-words must be focused (Lambrecht 1996:Chapter 5). Table 3.1 gives the parts of speech that are compatible with each type of fronting.

Table 3.1: Fronting properties of different words

	nouns	quantifiers	wh-words
Focus fronting	✓	✓	✗
Non-focus fronting	✗	✓	✓

3.1.3 Second-position clitics

The majority of clausal inflection in Nuuchahnulth is in a complex of second position enclitics which attach to the first word of the clause, modulo left extraction (§3.1.2). Table 3.2 shows the ordering of the clitic complex, and is adapted from Adam Werle’s grammar reference. A fuller list of these enclitics is given in Appendix B.3.

The $=\emptyset$ morpheme, which indicates the third-person neutral mood, merits some special attention. While there is no phonological element associated with this inflection, all of the other enclitics appear in their typical order around where it would be. A predicate with no enclitic, or with one or more of the

Table 3.2: Order of second position clitics

morph	=ʔaaq̃λ	=!ap	=!aλ	=!at	=uk =ʔak	=(m)it	=ʔi·š =ma· =ħa· =∅ ...	=ʔaaʎa	=ʔaʎ	=λa·
meaning	FUT	CAUS	NOW	PASS	POSS	PST	subject-mood portmanteaus	HABIT	PL	also

non-subject-mood enclitics (such as past, or habitual and plural) is always interpreted as being in the neutral mood with a third person subject. I do not put a =∅ in my gloss lines, except below in (23) to show that it is notionally present. The syntactic information about neutral mood and 3rd person subject has to come from somewhere and this can be modeled as a phonologically empty morpheme providing it. I address this more in the implementation section (§3.2.3).

The examples I have given so far have all shown this clitic complex attaching directly to the clausal predicate. However, it may also attach to preceding adverbial modifiers (20), conjunctions (21), and adpositions (22).³ Likewise, the relativizing enclitic article (§3.1.2) may also attach to a preceding modifying adjective (23) and not directly to the head noun, as seen in (9).

(20) ʔuuqʷaaʔaq̃λs ɳaačuk.

ʔuuqʷaa=!aq̃λ=s ɳaačuk

also=FUT=1SG look.for.DR

‘I will also look for it.’ (C, *tupaat* Julia Lucas)

³The claim that (22) is an adposition is somewhat controversial. Woo (2007) analyzes these as little-*v*, a category which does not exist in HPSG analyses. What this unit does is mark participants that fulfill a certain role with respect to the verb, similar to case-marking. An analysis that treats this particle as an adposition can generate the same set of sentences as a little-*v* analysis, and is necessary within the HPSG framework. In this model, non-agentive arguments may be realized by a Participant Phrase or an Adposition Phrase headed by *-L.(č)it*. This means that in (22), the word *hiišit* is an adposition phrase modifying the following verb *ʔiiqhuk*.

- (21) ʔahʔaaʔaʕna huʔacačiʕ ʔahkuu.

 mʉ-(y)aʔ(=∅) haa ʕaʔuu=ʔiʔ maʕtiʔ
 burn-CV(=NEUT.3) D3 other=ART house
 ‘The other house was burning.’ (C, *tupaat* Julia Lucas)

Every clause in Nuuchahnulth contains an enclitic, even if it is only the notional =∅ third person neutral enclitic. With the exception of left extraction, the enclitic always appears on the first word of the clause, which is either the predicate or a preceding adverb. Together with the restrictions on syntactic predicates, I use this data to claim that the clitic complex is the syntactic head of the clause in Nuuchahnulth, and the clitic complex selects for a predicate complement. The second position enclitic complex is then the auxiliary head of the clause, and inherits its valence (number of complements) from the predicate, which also provides the main semantic relation of the clause. Because of its second position properties, the analysis of Nuuchahnulth clitics requires some special attention in HPSG (§3.2.2), but descriptively I can stop at calling the enclitic complex the head of the Nuuchahnulth clause.

One final fact about the clause worth mentioning is clitic spreading. The presence of a clitic *in situ* within the second position complex is required. If the clause is passive, the passive morpheme must appear within the complex, and so on. However, some of these clitics may appear multiply within a clause: first in the second position enclitic complex, and then later on the predicate(s) of the sentence.

This occurs in cases where there is a preposed adposition (24),⁴ a preposed adverb (25, 28), a preposed quantifier (26),⁵ or a clefting construction (27). In all these cases, there is a syntactic reason for the second position clitic complex to fall on something other than the main predicate of the clause, and some of the clitics then appear multiply: first within the second position complex (obligatorily) and then later on the main predicate (optionally). To my knowledge, the only clitics that “spread” like this are *=!aλ* ‘now’ (24, 25), *=!at* PASSIVE (26, 27), and *=!ap* CAUSATIVE (28). I will come back to how multiple instances of the valence-altering clitics *=!at* and *=!ap* function within serialization structures in §4.2.2.

It is significant that in all the above examples, this syntactic doubling does not indicate any semantic doubling. In all of the examples, the unit that the second position enclitic attaches to is not notionally compatible with the semantics of “now,” or the application of a causative or passive.⁷ That is, the examples here all show a strictly syntactic, not semantic, phenomenon.⁸ This syntactic “doubling” is restricted to the clause in which the semantics of the morpheme apply. This can be seen in (29, 30) below, where the =ʔaʔ ‘now’ morpheme cannot be introduced in the subordinate clause, where it would alter the semantics in a bizarre or unintelligible way.

3.1.4 *Second position suffixes*

Another set of second position elements are verbal suffixes. Nuuchahnulth has a series of suffixing elements that attach to the leftmost item in their object. Although it is outside the scope of this dissertation, there is good independent reason to believe that these elements are suffix-like in the traditional sense, rather than clitic-like. Briefly, they are more tightly phonologically integrated into their root than the clausal clitics, they can attach to bound roots (the clausal clitics may not), and they occasionally produce unpredictable semantics. I will here simply assume their status as lexical suffixes with second position properties, rather than phrasal clitics.

The second position suffixes have been the locus of a fair amount of recent linguistic research in Nuuchahnulth, notably Waldie (2004), Wojdak (2005), and Woo (2007). Wojdak (2005) gives a detailed account of these suffixes under the Minimalist program. Wojdak breaks these suffixes into two broad categories, affixal main predicates (in my terminology, verbs which take plain participant complements) and affixal auxiliary predicates (verbs which take a complement that is predicative). I think this split is correct (although I will add some more basic categories), but disagree with her overall account in at least one important way that is not attributable to our difference in framework. Wojdak claims that these suffixes are insensitive to the category they attach to, but are ordered through linearity effects (p. 52–54) and that this is at root a syntactic and not morphological process. This claim captures a lot of good generalizations but I think it misses some complicating factors.

For instance, Wojdak claims (p.52–53) that the main predicate suffixes may attach to their nominal complement or a modifier of that complement (nouns, adjectives, quantifiers, wh- and relative pronouns). However, these suffixes also routinely attach to adverbs (see (37) below), in which case the adverb is clearly modifying the suffix verb itself. She also claims that the auxiliary predicates do not take

the root *ʔu-* (p.150), but this is not universally true of this class of suffixes, which enjoy a lot of lexical diversity (§3.1.4.2).⁹ Wojdak attempts a full account for the incorporation properties of all these suffixes, and in particular gives an excellent account of their scopal properties. I have the luxury of only addressing this incredibly complex part of Nuuchahnulth grammar in passing to my main point. I will give the attachment properties of the main predicate suffixes (3.1.4.1) and auxiliary predicate suffixes (3.1.4.2) as I understand them and have modeled them, without staking a claim to the exhaustiveness of this analysis. Despite some differences to my account, I would point the interested reader to Wojdak (2005) for a more complete accounting of these suffixes.

I break the second position suffixes broadly into three categories: (i) main predicate suffixes (§3.1.4.1), which are transitive (and ditransitive) verbs that take referential complements; (ii) auxiliary predicate suffixes (§3.1.4.2), which modify predicates which they subject control; and (iii) location suffixes (§3.1.4.3), which Wojdak (2005) treats as a subtype of the main predicate suffixes, but I believe have some special properties. Finally, I note some suffixes which do not appear to fall under any of the above categories (§3.1.4.4) and may represent further diversity among this class. I am only intending here to give an overview of these categories, only with sufficient detail will help illuminate later analyses.

3.1.4.1 *Main predicate suffixes*

The main predicate suffixes semantically relate referents (not events) to one another. They can be either transitive or ditransitive. That is, their basic semantic type is:

(31) $\text{RELATION}(e, x_1, x_2, (x_3))$

This includes relations such as HAVE, TAKE, FIND, GATHER/HUNT, CONSUME, and so on (expressed with *-na'k*, *-L.!iʔ*, *-L.waʔ*, *-R.!iih*, and *-iis* respectively). The only ditransitives in this group that I know of are the suffix *-ayit*, which expresses the relation GIVE.

I will use the suffix verb *-na'k* 'have' to illustrate the syntactic attachment properties of these suffixes.

⁹Her account of syntactic incorporation also has difficulty with idiosyncratic meanings, which one occasionally encounters with these suffixes. This is perhaps an unfair critique, however, as idioms are difficult for most syntactic theories, and these idiosyncrasies could be understood as idiomatic.

Each sentence in (32–34) shows a longer direct object of ‘have’: song, two songs, two long songs. The suffix verb always attaches to the first element in the object.

- (32) nuuknaaks.
 nuuk-na·k=s
 song-have=STRG.1SG
 ‘I have a song/songs.’ (N, *yuutnaak* Simon Lucas)

- (33) ʔaʕanaks nuuk.
 ʔaʕa-na·k=s nuuk
 two-have=STRG.1SG song
 ‘I have two songs.’ (N, *yuutnaak* Simon Lucas)

- (34) ʔaʕanaks ʔaaq nuuk.
 ʔaʕa-na·k=s ʔaaq nuuk.
 two-have=STRG.1SG long song
 ‘I have two long songs.’ (N, *yuutnaak* Simon Lucas)

Instead of attaching to a semantically contentful word, the suffix verb can attach to the empty root *ʔu-*, which I gloss as x. In this construction, the object can either appear after the suffix verb (35) or be dropped (36). Syntactically, the second position effect persists, if the *ʔu-* root is seen as part of the object, but carrying no semantic content.

- (35) ʔunaaks çiiqʔak.
 ʔu-na·k=s çiiq-ʔak
 x-have=STRG.1SG chant-for
 ‘I have a chant.’ (N, *yuutnaak* Simon Lucas)

(36) ʔiiq̣ḥiis ʔunaʔk.

ʔiiq̣ḥiis=s ʔu-naak

still=STRG.1SG x-have

'I still have it.' (N, Fidelia Haiyupis)

It is also possible for these elements to attach to an adverb. In this case, the adverb is always modifying the verb's event, as in (37).

(37) qiinaakitaḥ ʕiniiʕ̣.

qii-naʔk=(m)it=(m)aʔḥ ʕiniiʕ̣

long.time-have=PST=REAL.1SG dog

'I have had a dog for a long time.' (B, Bob Mundy)

This second position only scopes over the VP, and is separate from the clausal second position (§3.1.3). As seen already in (36) and (38), the clausal second position occurs separately from the second position of the suffix verb. I give two more examples of this clear separation in with a negator (38) and a conjunction (39).

(38) wikii ʔaanamaʕuḳ ʔišaq̣ ʔuyaq̣ḥmis.

wik=liʔ ʔana-L.maʕuḳ.DR ʔišaq̣ ʔuyaq̣ḥ-mis

and=STRG.1SG x-make what-do.first=POSS=DEFN.1SG mark-RS picture

'And then I made my first picture.' (N, Fidelia Haiyupis)

These suffixes typically cannot attach to verbs, as seen in (40,41). This makes sense if their semantics expect a referent and not event. With nouns and adjectives, syntactic incorporation incorporates a semantic referent (either that of the noun itself or of the adjective's modifyee). With verbs, there is no clear referent to compose with.

The reason I attempted the forms *ciqnaak* and *λihnaak* above is they both appear in the Nootka Texts (Sapir & Swadesh 1939, 1955). My consultant Julia Lucas decided that *ciqnaak* must be the equivalent of the modern word *ciqhsii* 'speaker' and corrected *λihnaak* to *λihaas*. Below are examples of the words as used in the Nootka Texts.

village

‘Then they had someone go in a canoe to invite the tribes of the inside region.’ (B, Tom Sayaačapis Sapir & Swadesh 1955:297–298)

I believe that the *-na·k* form here has different lexical properties from the *-na·k* form discussed above that is in use in the modern language. The *-na·k* seen in (42,43) has the meaning of *subject have someone do X on subject’s behalf*. It appears to be productive, as it also occurs on *hinatimiyis* ‘invite’ in (43), and a few other forms as well in the Nootka Texts. This is a very interesting form of suffix verb, but between the semantic difference and the fact that it is unrecognizable to contemporary speakers I’ve worked with, I believe that this is a case of two separate lexical meanings of a suffix. I think that the rest of my (and Wojdak’s) analysis for main predicate verbs, where verbal roots are generally not seen, still holds.

Despite the general rule in the modern language of forbidding lexical roots, some main predicate suffixes idiosyncratically attach to verbal roots, but the result yields unpredictable semantics. For instance, the suffix *-L.iʔa* ‘take’ can idiosyncratically attach to the verb root *hiikw-* ‘claw’ to yield *hiikw.iʔa* ‘take by clawing.’ This does not describe two actions: a clawing event, and then a taking event, but one event of seizing in talons or claws. This instrumentative reading is unpredictable and does not occur productively. Another example is the suffix *-(y)uʔat* ‘see’, which I have most commonly encountered attaching to the verb root *nač-* to form *načuʔat* ‘see (esp. a person).’¹⁰ This lexical doubling ‘see-see’ is again unpre-

¹⁰Though less common, is possible for *-uʔat* to attach in the “normal” way of a suffix verb as well, as in (44).

(44) ʔiihuʔalitaʔ quuʔas ʔuklaa Adam.

ʔiih-(y)uʔaʔ=(m)it=(m)a·h quuʔas ʔu-(k)la· Adam

big-see=PST=REAL.ISG person x-call Adam

‘I saw a big person named Adam.’ (B, Marjorie Touchie)

dictable. I treat all these cases of verb attachment as unanalyzable, single lexical items.

This class of suffixes also attaches to root forms, when available. This can be seen in words like *quuʔac-iic* ‘belonging to a Native person,’ where the bound root form *quuʔac* ‘person’ is used instead of the free form *quuʔas*. This also occurs with *tuč-naak* ‘have a wife,’ where the bound root form *tuč* ‘woman’ is used instead of the free form *tuucsma*. If a word does not have a special bound form, the free form is used.

The first class of second position suffixes, then, are transitive and ditransitive verbs that take referential arguments. They attach to the first element of their complement, either the noun itself or a modifying adjective, or they may attach to the semantically empty root *ʔu-* and take complements in the normal manner. They may also attach to an adverb, in which case the adverb modifies the semantics of the suffix verb itself. They do not generally attach to verbs, but when they do it is lexically specific and the result is semantically unpredictable.

3.1.4.2 Auxiliary predicate suffixes

The second class is auxiliary predicate suffixes. These tend to have modal or modal-like semantics, and relate a referent to an event. That is, the basic semantics are as below.

(45) $\text{RELATION}(e, x_1, e_2)$

They are also all subject control verbs (Wojdak 2005:p. 160): the subject of the auxiliary predicate must match the subject of the predicate’s complement. This means that the x_1 of the relation above is always identified with the (possibly passivized) subject of whatever the e_2 is.

Syntactically, these suffixes behave in some similar ways to the transitive verb suffixes and exhibit second position syntax. As I used *-naʔk* to exemplify the main predicate suffixes, I will use *-maʔsa* ‘want to do’ to exemplify the auxiliary predicate suffixes. The most straightforward way to use these suffixes is to attach them to a verbal predicate, as in (46). As a suffix subject control verb, the subject of the wanting event in (46) is the same as the subject of the grabbing event.

- (46) hišukaʔ čaakupiih suk^{wi}ʔmaḥsa ḥaa ḥaacsacumʔi
 hišuk=!aʔ čaakupiih su-k^{wi}ʔmaḥsa ḥaa ḥaacsacum=ʔi
 all=NOW man.PL hold-MO-want.to.do DDYN football¹²=ART
 ‘All the men want to get that *ḥaacsacum*.’ (C, *tupaat* Julia Lucas)

Like with the main predicate suffixes, this class of suffix can also attach to a preceding modifier of its argument. Since the normal argument of the auxiliary predicate suffixes is a verb, this means they can attach to a modifying adverb, as in (47).

- (47) ʔaanimahsas waa ʔin čamiḥtaʔaʔni ʔiihʔiiḥa ...
 ʔaani-maḥsa=s waa ʔin čamiḥta=!aʔ=niʔ ʔiihʔiiḥa ...
 only-want.to=REAL.1SG say COMP proper=NOW=NEUT.1PL do.something.important ...
 ‘I only want to say that we are doing something important ...’ (N, *yuutnaak* Simon Lucas)

It is much less common, but these suffixes can attach to adjectives and nouns. I only have one example of *-maḥsa* attaching to an adjective in my corpus (48), but I found an example of nominal attachment in the Nootka Texts (49). In both of these cases, the non-verbal element is being treated predicatively and eventively: ‘be strong’ in (48) and not ‘a strong (something)’, and ‘be a chief (i.e. wealthy)’ in (49), and not ‘a chief.’ I take this as corroborating evidence of the inherent eventiveness of adjectives and nouns (§3.1.1).

- (48) ʔunʔuuʔhwaʔiʃʔaʔ ʔin ḥaaʔakmaḥsapsuuk ḥaamiiqsu.
 ʔunʔuuʔ-(q)ḥ=waʔiʃ=ʔaʔ ʔin ḥaaʔak-maḥsa=!ap=suuk ḥaamiiqsu
 because-LINK=HRSY.3=HABIT COMP strong-want.to.do=CAUS=NEUT.2PL older.sibling
 ‘It’s because you want to make your older sibling strong.’ (C, *tupaat* Julia Lucas)

¹²A *ḥaacsacum* is not quite a football. It is a ball that is used in a certain kind of *tupaati* competition. The object is for competitors to seize the ball and lift it above their head.

(49) *ʔuunuʊʔitaḥ ʔaḥkuu ḥawil-miḥsa waaʔaʔ.*

ʔuunuʊʔ=(m)it=(m)a·ḥ ʔaḥkuu ḥawil-miḥsa waa=!aʔ

because=PST=REAL.1SG D1 chief-want.to.do say=NOW

‘“It was because of this that I wanted to be wealthy (= a chief),” he said.’ (B, Tom saayaačapis, Sapir & Swadesh 1955:25)

Unlike the main predicate suffixes, these suffixes attach to the empty root *ʔu-* only idiosyncratically, and when they do they may have a default interpretation. The suffix *-maḥsa* happens to be one that does attach to *ʔu-*. In the absence of an object, *ʔumaḥsa* has the interpretation of wanting someone sexually.

(50) *ʔiiqḥukaʔ hišuk maʔas ʔin ʔumaḥsiičiʔ.*

ʔiiqḥuk=!aʔ hišuk maʔas ʔin ʔu-maḥsa-i·čiʔ

tell.DR=NOW all village COMP X-want.to.do-IN

‘He told the whole village that he wanted her (as his wife).’ (C, *tupaat* Julia Lucas)

Other suffixes I put in this category, however, cannot take the *ʔu-* root, despite otherwise behaving in a similar manner to *-maḥsa*. This includes *-wiʔas* ‘going to do’, *-L.sinḥi* ‘try to do’, and *-qaʔḥ* ‘claim, pretend.’ I treat the *ʔu-* attachment of these event-taking suffixes as lexically specified.

Auxiliary predicate suffix verbs semantically modify a complement that is an event. Typically this means they syntactically attach to a verb (46), but they can modify the event properties of an adjective or noun as well (48, 49). These suffixes exhibit the same second position properties of the main predicate suffix verbs, and may attach to an adverb modifying a later predicate complement (47). They only idiosyncratically attach to the root form *ʔu-*.

3.1.4.3 Location suffixes

I believe there is a separate category of second position suffixes, which is location suffixes that relate a figure to a ground. This includes *-čuʔ* ‘inside a container’ and *-!as* ‘outside.’ These suffixes freely attach to both nouns and verbs, and for both they modify the location, either the location of the noun (e.g., *ʔink* ‘a fire’ and *ʔinkʔas* ‘a fire outside’) or the location of the verb (e.g., *pisat-* ‘play’ and *pisatʔas* ‘play outside’).

It is possible that these may be simple event modification, since nouns are eventive (§3.1.1), and collapsible with auxiliary predicate suffixes. However, there are further differences. Locative suffixes also tend to attach to the empty root *hita-* or *hina-*, instead of *ʔu-*, as in *hitaas* ‘outside’. But they also sometimes attach to *ʔu-* as well, as in *ʔuʕuu* ‘inside (something)’. I do not have an analysis for this, and leave description of the locative suffixes for future work. I have not analyzed these suffixes in my implemented grammar.

3.1.4.4 Other categories

With the possible exception of the location suffixes, all these categories so far are eventive. The main predicate suffixes relate two referents, but are themselves events that can be modified by an adverb, and behave as a predicate in the syntax (§3.1.4.1). The auxiliary predicate suffixes relate a referent and an event, but again are events in their semantics¹³ and syntactic predicates (§3.1.4.2).

There appear to be a few suffixes that are treated as non-predicative in the syntax, and are participants in the syntax, or ambiguously so, as with nouns. This category, if it exists, may only consist of *-yak/ʕak* ‘for, used for’ and *-ʃaʕ* ‘the sound of’. These endings can be placed on verbal suffixes, such as *pisat-* ‘play’ to form a noun, *pisatʔyak* ‘manner of play’, or complex roots to form a more complex noun, as in *pikčas-ʕu* ‘pictures-inside’ to form *pikčasʕuʔyak* ‘television.’ However they can also be used with the empty root *ʔu-*, as in the following sentence, taken from a recording of the late Barbara Touchie by Henry Kammler:

¹³The argument for this is a little bit theory-dependent, but the auxiliary predicate suffixes may be the topmost predicate in a clause, and on the assumption that sentences are propositions, thus need to be events that can be evaluated for truth value.

(51) ?aanačilsamaḥ ḥamaṭap hiḥukʷitii mamaḥṭi ?uṽyak mamu?asminḥ?i, shacks ?uklaamit.

 work-outside.DR-PL=ART shacks x-call=PST

‘The only thing I remember is they would go to the houses used for working outside, called shacks.’

(B, Barbara Touchie)

There is also the ending *-ckʷi·* ‘evidence, remains of,’ which can attach to bare roots to form nouns (*yackʷii* ‘footprint’), but which can also attach to fully inflected predicates and create a predicative meaning (*hawiiqλckʷi?iš* ‘they must have been hungry’). It is possible that *-ckʷi·* is ambiguously a participant-forming suffix or an auxiliary predicate suffix, or that it belongs to another class altogether. As with the locatives, and as with *-ṽyak/čak* ‘for’ and *-ʔaλ* ‘the sound of,’ I do not have an implemented analysis for this category, nor know how many suffixes belong to it.

3.1.4.5 Note on adpositions

I will make an argument later on that some of the main predicate suffixes are best modeled as adpositions (§5.2.3). Most importantly, this will include the object-marking *-L.(č)it*, which Woo (2007) analyzes as *v* within the Minimalist Program. The reason I use the term ‘adposition’ rather than *v* is largely theory-internal: There is no such category as *v* within HPSG, and I need to account for the grammatical phenomenon somehow. We are describing the same data, and I don’t think this difference in framework makes any difference in empirical claims. Anticipating the need for prepositional suffixes, I will simply note that the way I treat *-L.(č)it* will not differ greatly from how I treat ordinary main predicate suffixes except that the type of the phrase will be defined as an *adposition* rather than *verb*.

3.1.5 Verbal aspect

Finally, I will sketch the aspectual system of Nuuchahnulth and my understanding of it. (Sapir & Swadesh 1939:240–241) analyze the aspect system as containing twelve forms. I will list them along with

the examples given based on the verbal root *mitx^w*- ‘turn,’ translated into the modern orthography.

1. Durative *mitx^waa*
2. Inceptive *mitx^wičičiļ*
3. Graduated Inceptive *miitx^wičičiļ*
4. Pre-inceptive *miitx^wičičiļšiļ*
5. Inceptive iterative¹⁴ *miitxmiitx^wičičiļ*
6. Repetitive *miitxmiitx^wa*
7. Repetitive inceptive *miitxmiitxšiļ*
8. Momentaneous *mitxšiļ*
9. Graduative *miitxšiļ*
10. Pre-graduative *miitxšiļšiļ*
11. Iterative *mitxmitxš*
12. Iterative inceptive *mitxmitxššiļ*

Several of these aspects are composites. The only unitary aspects in this list are: durative, inceptive, repetitive, momentaneous, and iterative. The graduative (a long-short template, or LS) may be applied to inceptive and momentaneous forms, and the momentaneous may apply to any of the forms that do not terminate with a momentaneous or inceptive aspect.

In her dissertation, Rose 1981 (p.263–269) splits Sapir & Swadesh’s durative category into two: a durative aspect (marked with -ak or -uk) and a continuative aspect (marked with a -(y)a’). This distinction was continued in both Nakayama 2001 (p.26–27) and Davidson 2002 (p.232–237). Davidson describes the durative as expressing ‘intransitive imperfective state’ or ‘imperfective process,’ and follows Rose in saying the continuative expresses a dynamic situation, in the sense that energy input is necessary to continue the action. At least in Davidson’s version, the continuative can go on to take the inceptive (p. 246) and although he does not give it in the aspect chart, the durative can go on to take the perfective (p. 155).

¹⁴This form is rare in the modern language and complex. I will not give it much attention, but it is discussed in detail as the “Iterative II” in (Davidson 2002:242–244), where he claims that it is not inceptive but merely a formal alternate to the typical iterative.

Figure 3.1: Traditional verbal aspect flowchart

Taking this system as a baseline, the number of total possible aspects increases to 14, and a flow chart of aspect forms looks like Fig. 3.1. The nodes in the graph are fully inflected aspectual forms (save for the leftmost starting node, which is an aspectless verbal root), and the lines show the basic allomorph that is added to the stem to create the aspect form. Not every root takes every form, but if one basic aspect form is possible (e.g., the repetitive) then the forms after it are possible (e.g., the repetitive momentaneous). I have regularized the naming conventions somewhat from Sapir & Swadesh, and in the graph give next to each aspect form a number affiliating it with their list. Number 13 is for the continuative aspect and

14 is for the durative-momentaneous. A box is drawn around perfective forms.

In this schema, which is the one I have implemented in my grammar (§3.2.4), the continuative and inceptive are unusual aspect types. The inceptive can either go on the bare root or the continuative (but not other aspects), and the continuative is the only basic imperfective aspect form that cannot take the momentaneous *-šił* or the graduative.

Adam Werle has convinced me (*p.c.*) that this view is inaccurate, and that the “inceptive” is in fact the same as the momentaneous. The *-i'čičił* form is simply the form that the momentaneous takes under certain morphophonological conditions, namely: (1) after the continuative; (2) on monosyllabic roots that have a coda. In the limited tests I did with consultants, this appears to be correct. There are a small number of verb roots that can take both an inceptive and a momentaneous-graduative, but not a bare momentaneous, aspect. In the cases I tested, speakers were convinced that the momentaneous-graduative and inceptive forms had exactly the same meaning. One example is the root *mut-* which refers to the tide coming up. The continuative *mutaa* means ‘tide coming up’ while speakers tend to translate *muutšił* as ‘tide is coming in,’ insisting this is distinct from *mutaa*. *muutšił* looks like a momentaneous-graduative (with a lengthened first vowel), but speakers said there was not a word **mutšił*, which would be the bare perfective.¹⁵ I asked if there existed a word *mutiicił* and both speakers I asked (Fidelia Haiyupis, northern dialect, and Bob Mundy, Barkley sound dialect) said yes, and insisted it had the exact same meaning as *muutšił*. This follows from Werle’s understanding of the *-i'čičił* form as the momentaneous applying after a continuative.

There is also the fact that there are certain monosyllabic, closed syllable roots which always take the *-i'čičił* and never *-šił*. These forms are idiosyncratic and have to be learned. For instance, the perfective form of the negator *wik* is *wikiicił* and never **wikšił*. Likewise the adjective *łac* ‘fat’ becomes *łaciicił* ‘become fat’ and not **łacšił*, *ław* ‘be near’ becomes *ławiicił* ‘come near’ and not **ławčił*, and *łuh* ‘be’

¹⁵There exists a fairly large number of verb forms that have what looks like a graduative template (LS) but do not seem to have any graduative meaning, and the template cannot be removed. As far as I know this only happens with momentaneous (or perfective, as I will call it below) forms and durative forms. *muutšił* ‘tide coming in’ belongs to this group of perfective forms that include a LS template. It is joined by *yaacšił* ‘walk’ from the root *yac-* ‘walk’, and *tuupšił* ‘become dark’ from *tupk-* ‘black.’ The durative forms with an LS template include the *yaacuk* ‘walking’ also from the root *yac-* ‘walk,’ *šiiłuk* ‘move house’ from *šił* ‘move,’ and *łiihak* ‘paddling’ from *łih* ‘paddle.’ In my implementation, I simply treat these as irregular verb forms, but more work needs to be done to understand why this lengthening template applies to these particular roots.

becomes *ʔuhiičičiλ* ‘become’, not **ʔuhšičiλ*. According to this analysis then, the “inceptive” is not a unique aspect form but a morphophonologically conditioned alternate of the so-called momentaneous. This collapse makes the aspect system of Nuuchahnulth look a little more typical of languages around the world. There is a perfective aspect, marked with a large number of allophones but namely *-šičiλ* and *-ičičiλ*, and then a variety of imperfective aspects (repetitive, iterative, durative, continuative, and gradative). Verb stems that are perfective may take the gradative (once) to become imperfective, and imperfective verb stems may take the perfective *-šičiλ*. The simplified flow chart is in (3.2) below.

Figure 3.2: Revised verbal aspect flowchart

Despite this revised analysis, most of my work was done under the traditional understanding of the aspect system (Fig. 3.1), and I will continue to use the inceptive marking *IN* in this document. When I turn to the implementation, I will describe the implementation of an aspect system that includes the

inceptive (§3.2.4).

3.2 HPSG Analysis and Implementation

I will now go over how I have modeled the above syntactic facts about clauses in my HPSG implemented grammar. Though the framework is particular, much of this analysis should be intelligible to people working in other frameworks. For those more familiar with other syntactic formalisms, I will attempt to give some basic guidance to decoding the formalism.

In HPSG, each node in a tree is a large attribute-value matrix defining the properties of the node (this includes leaf nodes or words). Attributes are things like `HEAD` and a value may be something like *noun*. This is written as `[HEAD noun]`. Values can be a simple atomic symbol or they can be another attribute-value matrix. For instance, *noun*, which is a possible value for `HEAD`, is itself a matrix with further information inside it, such as `[FORM finite]`. HPSG is dedicated to fidelity to the surface string order, and there is no movement. Syntactic relations are described through valence lists present at each node in the tree. The two most common of these lists are `SUBJ` (subject) and `COMPS` (complements). As the tree is constructed, information is added to (or more precisely, unified with) `SUBJ` and `COMPS` values, which is how valence information is preserved. Long-distance dependencies which in other theories are modeled through movement are here modeled by moving a valence item from the `SUBJ` or `COMPS` list into a `SLASH` list, which propagates up the tree until the extracted element is found.

In addition to the matrices present at each point in the tree, the phrase structure rules (PSRs) have to be defined for each possible ordering. So there may be a *HEAD-COMPLEMENT-RULE* which defines how a head node combines with a non-head node to its right. This is analogous to *merge* in Minimalism, although in HPSG the rules about which merges are allowed are specified within each PSR. A PSR may specify that one of its daughters has to have a certain property: for instance, when discharging a long-distance dependency, the head daughter should have something on its `SLASH` list, and the non-head daughter needs to have properties consistent with what the head daughter says about the item on its `SLASH`. This unification is indicated through reentrancies (drawn as boxes with the same label) which specify that two items in the attribute-value matrix are in fact the same.

In another case, a PSR might say that its head daughter needs to be `[HEAD.AUX +]`. In this case,

that rule cannot operate on a node that is defined as $[\text{HEAD.AUX } -]$. However, we allow for values to be underspecified. A node may not know if it is an auxiliary or not, in which case it is simply $[\text{HEAD.AUX } \textit{bool}]$, our way of denoting underspecification. A node of this type can unify with PSRs that require $[\text{AUX } +]$ and $[\text{AUX } -]$. However, once it goes through that kind of rule, its *AUX* value is set. This is how the framework allows words and even phrases to be used in different ways in different tree structures. Complex forms of type hierarchies are important to unification in HPSG. While the type *bool* only has two subtypes, $+$ and $-$, the types available to *aspect* may be far more complex, which then allows for more complex types of underspecification and unification.

My grammar is built on top of analyses present in the Grammar Matrix (Bender et al. 2002), and where possible I reuse distinctions and analyses present there. In particular, I use some of the features defined in the Grammar Matrix (like *PRD*, *AUX*), and inherit from generic phrase structure types like *DECL-HEAD-SUBJ-PHRASE* and *BASIC-UNARY-PHRASE*. I will not expect familiarity with all these pre-defined types, and will attempt to give all the relevant components of rules and type definitions, including those that are defined in the Grammar Matrix. However, most definitions given here are subsets of full definitions given in my implemented grammar, which can be found at <http://bitbucket.org/davinman/nuuchahnulth-grammar/>. I will not go over every analysis here, but only those I believe are the most significant for later discussion: the predicate and participant distinction (3.2.1), the second position clausal elements (3.2.2), the second position suffixes (3.2.3), and verbal aspect (3.2.4).

3.2.1 *Predicates and participants*

As argued in §3.1.1, nouns, adjectives, and verbs are all events, and yet when used as participants, the grammar needs to distinguish nouns from adjectives and verbs (§3.1.2). I use the value *PRD* (predicative) on the *HEAD* feature to model the predicate/participant distinction in Nuuchahnulth. I have a supertype, *predicate-lex*, which states that its *HEAD.PRD* value is $+$. All the lexical types that are predicative—verbs, and adjectives, and common nouns—inherit from this supertype. So every lexical entry for a verb, adjective, or common noun inherits the property $[\text{HEAD.PRD } +]$, and can be treated as a predicate where the grammar demands it.

Participants are simply defined as $[\text{HEAD.PRD } -]$. A word can be defined as $[\text{HEAD.PRD } -]$ by its lexical

inheritance (e.g., proper nouns are defined as non-predicative), or through the application of a rule. As detailed in §3.1.2, all dependent clauses headed by the enclitic *=ʔi* are participants. I will address the analysis for this in §3.2.2. However, common nouns also need to be treated as participants as well as predicates. I achieve this through a lexical rule (that is, something that must apply prior to syntactic rules) that alters the syntactic properties of the noun. Recall that as predicates, common nouns have an event variable and a subject. Part of my type definition for a common noun is given in (52).

This rule can most easily be read bottom-to-top. It states that common nouns are semantically a relation between two arguments: an event, and a referential index.¹⁶ The referent argument is identified with the INDEX attribute of the only thing in the noun's syntactic ARG(UMENT)-ST(RUCTURE). ARG-ST is used in HPSG as a translation layer between the semantics (the RELS list) and the syntax (in the SYNSEM

¹⁶Note the underspecified PRED value. Not to be confused with my use of "syntactic predicate," the PRED(ication) value in the DELPH-IN HPSG implementation is the name of the relation. So the Nuuchahnulth word *ʔiniil̥* 'dog' has the meaning ʔINIIL̥, or for intelligibility for an English-language readership, DOG.

layer above). All items on a word's ARG-ST must correspond to items in its valence lists (most notably, SUBJ(ect) and COMP(lement)s). The lone item in the noun's ARG-ST is identified with its subject, and it has no complements. The semantic argument that is the available in the compositional syntax, at the path SYNSEM.LOCAL.CONT.HOOK.INDEX, is that of the event variable in the relation, and so the noun is treated as eventive in the compositional semantics. The variable to the referent is kept on the XARG, a sort of semantic scratch paper that is typically used for subjects. Finally, the HEAD.PRD attribute is set to +, indicating that common nouns, and all subtrees headed by a common noun, are predicative. This is a syntactic reflex indicating that the INDEX is pointing to an event.

The above *COMMON-NOUN-LEX* type functions when nouns are acting as predicates. To treat nouns as participants, they must go through a lexical rule first. The major parts of the lexical rule are in (53).

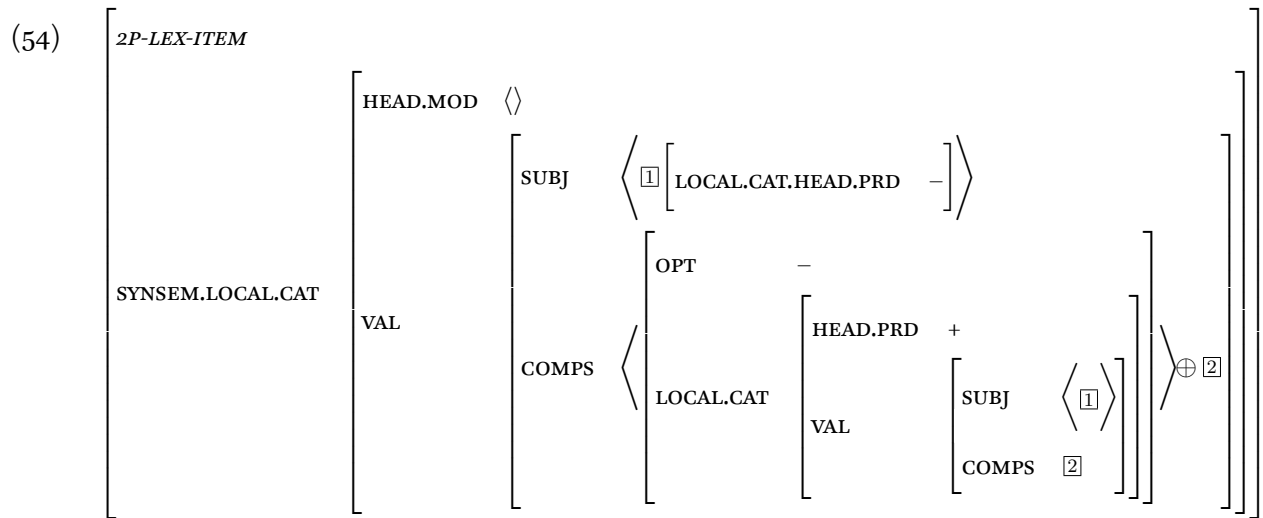

$$(53) \left[\begin{array}{c} \text{NOUN-RELATIVIZER-LEX-RULE} \\ \\ \text{SYNSEM.LOCAL} \\ \\ \text{DTR} \end{array} \left[\begin{array}{c} \text{CAT.HEAD} \\ \text{VAL} \\ \text{CONT.HOOK.INDEX} \end{array} \left[\begin{array}{c} \left[\begin{array}{c} \text{noun} \\ \text{PRD} \quad - \end{array} \right] \\ \left[\begin{array}{c} \text{SUBJ} \quad \langle \rangle \\ \text{COMPS} \quad \langle \rangle \end{array} \right] \\ \boxed{1} \end{array} \right] \left[\begin{array}{c} \text{SYNSEM.LOCAL} \\ \text{CONT.HOOK.XARG} \end{array} \left[\begin{array}{c} \left[\begin{array}{c} \text{CAT.HEAD} \\ \text{PRD} \quad + \end{array} \right] \left[\begin{array}{c} \text{noun} \end{array} \right] \\ \boxed{1} \end{array} \right] \end{array} \right] \right]$$

This rule takes a daughter that is headed by a noun. It creates a new lexical item that has no subject or complements, and is not predicative, making it a participant. It moves the noun's XARG value into its INDEX, so that in the compositional semantics, it is being treated a referent and not an event. The article will do something similar to this, but as part of the second position inflection, I will address it with other second position elements below.

3.2.2 Second position inflection

As detailed in §3.1.3, Nuuchahnulth clauses are headed by their second-position inflection. I define the second position elements as selecting for a complement that is $[\text{HEAD.PRED } +]$. I call this complex of a second position element and its predicate a *predicate phrase* (abbreviated PredP). By design, within a PredP there is no differentiation between ‘verb,’ ‘adjective,’ and ‘noun,’ as the distinction is irrelevant in this context.

Second position elements take a predicate to their left and inherit all their predicate’s syntactic participants. The basic type definition for a second position clitic is given in (54).

This lexical definition states that second position clitics are non-modifying words which have both a subject and a complements list. Its first complement is a non-optional predicate, which has a subject and some number of complements (possibly zero). Its first complement’s subject is identified as its own subject, and its first complement’s complements list is appended to its own complements list. So if this lexical item finds an intransitive predicate complement, it becomes a transitive item: Its subject is its complement’s subject, and its only complement is the intransitive predicate it picked up. If this lexical item finds a transitive predicate, it becomes ditransitive. Once again, it will have a subject identified with that transitive predicate, and then its complements list will include two items: first the transitive predicate itself, and then the transitive predicate’s own complement. And so on.

As indicated in §3.1.3, there are two major types of clausal second position lexemes: the auxiliary predicate head, and the article. The predicative versions are part of the mood complex, and belong to the type *MOOD-2P-VERB-LEX* (55), which inherits from (is a subtype of) *2P-LEX-ITEM* above. This rule needs to state that this lexical item makes a predicate and inherits its complement's semantic event. Then the lexical entry for each morpheme further specifies the clitic's particular properties: the mood of the complement, and the person and number properties of the subject.

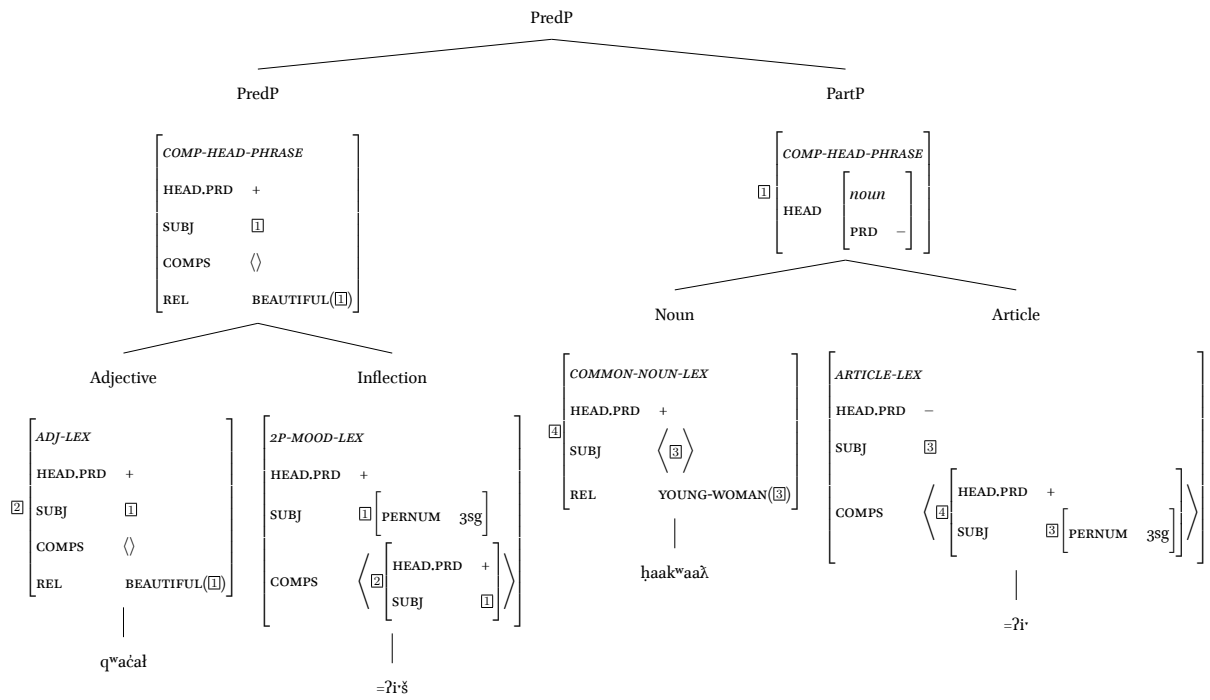

$$(55) \left[\begin{array}{c} \text{MOOD-2P-VERB-LEX} \\ \\ \text{SYNSEM.LOCAL} \end{array} \left[\begin{array}{c} \text{CAT} \\ \\ \text{CONT.HOOK.INDEX} \quad \boxed{1} \end{array} \left[\begin{array}{c} \text{HEAD.PRD} \quad + \\ \text{VAL.COMPS} \quad \left\langle \left[\dots \text{INDEX} \quad \boxed{1} \right], \dots \right\rangle \end{array} \right] \right] \right]$$

The article lexeme also inherits from *2P-LEX-ITEM*, but adds different constraints (56). The article needs to state that it creates a participant (that is, a non-predicate), that it is picking up its complement's subject's semantics (that is, the referent and not the event), and that that referent is in the third person.

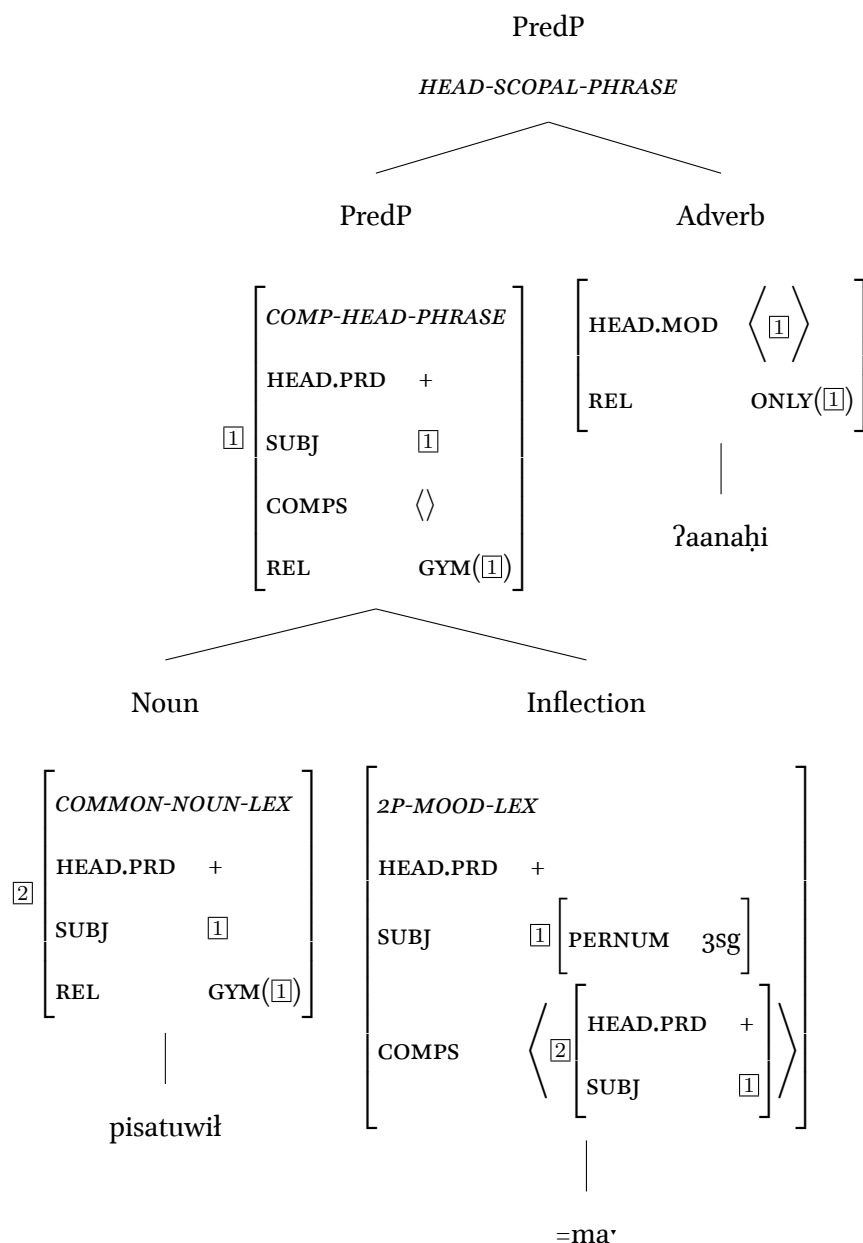

$$(56) \left[\begin{array}{c} \text{ARTICLE-LEX} \\ \\ \text{SYNSEM.LOCAL} \end{array} \left[\begin{array}{c} \text{CAT} \\ \\ \text{CONT.HOOK.INDEX} \quad \boxed{1} \end{array} \left[\begin{array}{c} \text{HEAD.PRD} \quad - \\ \text{VAL.COMPS} \quad \left\langle \left[\dots \text{SUBJECT} \quad \left[\dots \text{INDEX} \quad \boxed{1} \right] \right], \dots \right\rangle \right] \right] \left[\begin{array}{c} \text{PNG.PER} \quad 3\text{rd} \end{array} \right] \right] \right]$$

The above definitions for second position elements license trees that have simple second position elements. I will give sample trees for the three types of predicates introduced in §3.1.1: verbs (8), adjectives (9), and nouns (10). Trees for each of the sentences are given in (57), (58), and (59) respectively. The attribute-value matrices have been somewhat simplified to fit on the page, and identifying semantic features (through *HOOK.INDEX* and *HOOK.XARG*) have been elided. Identification of semantic features

(58)

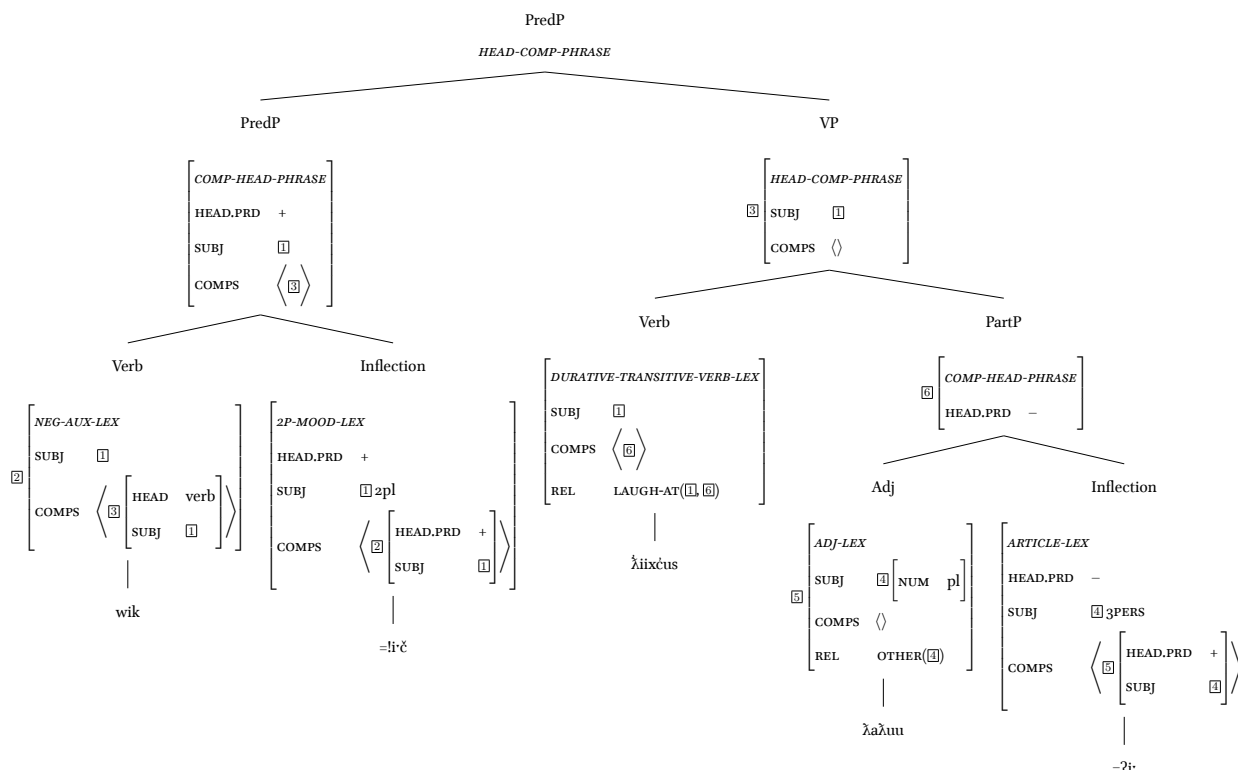

(59)

(57–59) show predicates of different lexical categories. This is straightforward because all these lexical categories are [PRD +], and thus can be the complement of the inflecting second position element. In the same way, predicative elements like verbs (60) and adjectives (61) can become participants through composition with the article =ʔi, as shown below.

(61)

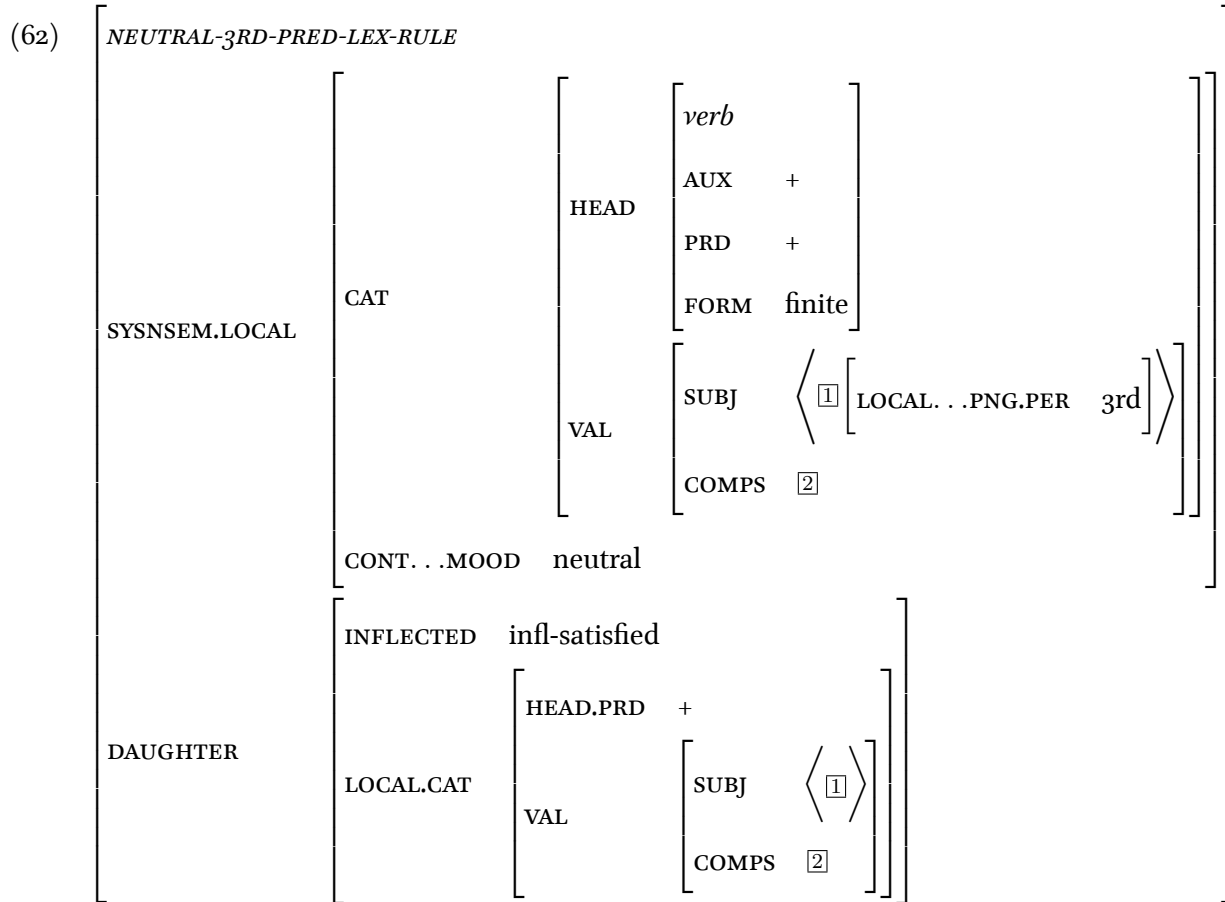

This analysis depends on viewing the second position enclitic complex as its own syntactic word. Since my implementation currently lacks a morphophonological component, I have whitespace-separated the second position enclitic complex. It also requires that only one of the enclitics inherit from (54): one of the enclitics must be the head of the syntactic word. Every enclitic is optional, with the exception of the subject-mood portmanteaus. Given this, I have modeled the subject-mood portmanteau as the root, with preceding enclitics attaching to the subject-mood portmanteau as “prefixes” and following morphemes attaching as “suffixes” that modify the appropriate syntactico-semantic properties.

This creates an analytical issue for the third person neutral mood, which is null-marked. Notionally, there is an invisible “=o” in the string, but to avoid it being written in the output, I use some work-arounds in the DELPH-IN architecture. There are two cases where the null third person element is introduced: (1) when there are other enclitics (the habitual or causative, for example) but no subject-mood portmanteau; (2) when there are no enclitics at all, only the understood null third person neutral mood. My grammar handles the two cases differently.

In case 1, the string “=o” is generated just like any other enclitic. I define a special inflectional flag SOME-INFLECTION and set its value to – just for the third person neutral. This means that a string consisting only of “=o” is not fully inflected and not allowed to be a word. For all of the prefixes and suffixes, I allow them to overwrite the string “=o” with themselves, and these inflectional rules set the SOME-INFLECTION flag to +. This means that the first prefixing or suffixing element to be added to the enclitic makes it a fully inflected word, and removes the “=o” from the output. So the string “=ʔaala” (habitual) is underlyingly “=o=ʔaala”, and the subject and mood information is generated by the “=o”.

In case 2, there is no additional enclitic to overwrite the “=o” string, so this approach does not work. In this case, I create a lexical rule which takes any fully-inflected predicative word and creates a second position auxiliary out of it with the information of the third person neutral mood embedded in its semantics. I do not believe this analysis is notionally different from a null morpheme. It has the vice of being a little more complicated, but the virtue of not outputting any unpronounced elements in the string. The predicate-to-third-person-neutral rule looks like this:

Finally, the second-position clausal clitics need to be able to attach to a preceding modifier of the predicate. In the case of the main clause predicates, they may attach to preceding adverbs, and for the article it may attach to preceding adjectives. Because there is no movement in HPSG, my analysis cannot simply say that clitics “move” into position of the leftmost item in the phrase. There are benefits to this design decision (faster computation, fidelity to the ordering of the surface string, bidirectionality of parsing and generation), but second position phenomena is one of the areas that requires extra analytical work in HPSG.

In both the cases where the mood clitic attaches to a preceding adverb (20) and when the article attaches to a preceding adjective (23), the second position enclitic containing the subject information is attaching to a modifier of a later predicate. In the version of the lexical entry seen in (54), these clitics are selecting for predicate complements, to which they assign semantic information (such as tense), and

taking on their subject and complements. However, in the case where the clitics attach to a modifier, I cannot model the clitics as selecting for a predicate. I must have the clitic select for a modifier, and assign its semantic information to the modifier's modified value.

I define a lexical rule which creates the appropriate modifier-selecting structure from lexical entries of the type (54). Because the mood enclitics are creating a structure that is a semantic event and the article enclitic is creating a structure that is a semantic referent, the manipulations done to these two categories need to be somewhat different. I have two types for this: *AUXILIARY-UNARY-TYPE-RAISE-CLAUSE* and *AUXILIARY-UNARY-TYPE-RAISE-ARTICLE*. Each of these inherit common properties from a common supertype, *AUXILIARY-UNARY-TYPE-RAISE-SUPER*, the key parts of which are replicated below.¹⁷

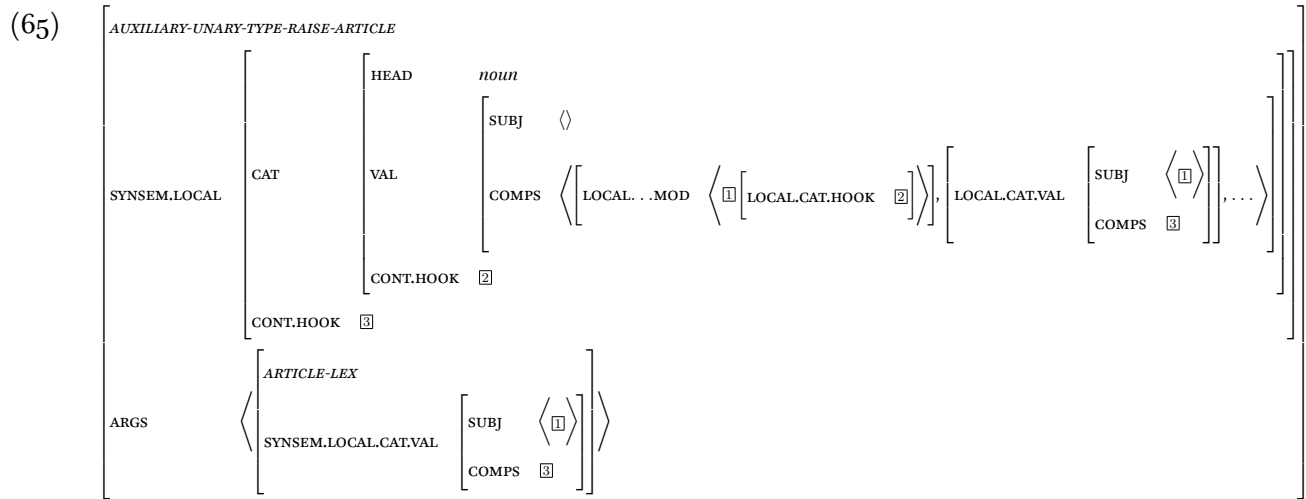

$$(63) \left[\begin{array}{c} \text{AUXILIARY-UNARY-TYPE-RAISE-SUPER} \\ \text{SYNSEM.LOCAL.CAT} \left[\begin{array}{c} \text{HEAD} \left[\begin{array}{cc} \text{TYPE-RAISE} & + \\ \text{AUX} & + \end{array} \right] \\ \text{VAL.COMPS} \left\langle \begin{array}{c} \text{SYNSEM.LOCAL.CAT} \left[\begin{array}{c} \text{HEAD.AUX} \quad - \\ \text{POSTHEAD} \quad - \\ \text{OPT} \quad - \end{array} \right], \textcircled{1} \left[\text{SYNSEM. . . POSTHEAD} \quad + \right] \oplus \textcircled{2} \end{array} \right\rangle \end{array} \right] \\ \text{ARGS} \left\langle \begin{array}{c} \text{SYNSEM.LOCAL.CAT} \left[\begin{array}{c} \text{HEAD} \left[\begin{array}{cc} \text{TYPE-RAISE} & - \\ \text{AUX} & + \end{array} \right] \\ \text{VAL.COMPS} \left\langle \textcircled{1} \left[\text{SYNSEM. . . POSTHEAD} \quad - \right] \oplus \textcircled{2} \end{array} \right\rangle \end{array} \right] \end{array} \right\rangle \end{array} \right]$$

This supertype states that type auxiliary type raising is a unary operation that takes some auxiliary which has not been type raised, marks it as type raised, and adds one item to its complements list. The item that was previously the first complement and was [POSTHEAD –] (that is, had to be realized to the left) is now the second complement and is [POSTHEAD +] (that is, realized to the right). The supertype does not say much about the added complement, as that is left for its two daughter rules, in (64) and (65) below.

¹⁷For brevity, I have pretended in (63) that I can modify the POSTHEAD value from + to –. In fact, in my implementation I have to copy up every other value, changing only POSTHEAD.

This rule specifies that the old subject is the same as the new subject, and the semantic value and type of the construction (the *HOOK*) is the same as the old one. That is to say, it is still an event, and has the same subject. The new complement introduced has a *MOD* value which is identical to the second complement (what was previously the first complement). So the *AUXILIARY-UNARY-TYPE-RAISE-CLAUSE* appends a new element to the beginning of the complements list which is a modifier of the old first complement. The article type raising rule is in (65). It contains a few differences to account for the difference in semantic type.

This rule creates a noun instead of a verb. Like its sister rule, the first item on the complements list is a modifier. However, instead of that modified value being identified with the second complement, it is identified with the second complement's subject. This is because that complement can be any predicate: noun, verb, or adjective. Since predicates are events that have their referential index associated with their subject, the modifying adjective needs to grab a hold of the subject value. Related to this, the rule's semantic content (its *HOOK*) is identified with that modified element's hook, rather than the *HOOK* of the original *article-lex*. With these rules in place, I can now parse sentences with a leading adverb, and participant phrases with a leading adjective. The enclitic will simply go through the appropriate type-raising lexical rule first.

3.2.3 Second position suffixes

In §3.1.4 I give some examples of second position suffixes. The two classes that I have implemented are the “main predicate” suffixes and the “auxiliary predicate” suffixes. I will first show my implemented analysis of the main predicate suffixes. As a reminder, all these types are partial representations of the full type, which is present in the implemented grammar. Certain features—such as well-formedness for inflection and restricting daughter types by morphological class—are omitted in the interest of space and clarity.

I will here point out that an analysis of second position suffixes in Nuuchahnulth in HPSG has been

done in Waldie (2004). However, Waldie's analysis uses linearization: an augmentation to basic HPSG theory that allows for word scrambling. My analysis, grounded in the DELPH-IN formalism, does not have linearization. In my analysis, I am constrained by the surface order of suffixation and incorporation.

3.2.3.1 Main predicate suffixes

Main predicate suffixes are the class of verbal suffixes that may attach to a noun, in which case the noun satisfies the verb's complement, an adjective, in which case the adjective modifies the verb's (possibly dropped) complement, or an adverb, in which case the adverb modifies the verb itself.

All incorporating suffixes are modeled through the application of two successive lexical rules. The first lexical rule applies to the incorporated element (the noun, adjective, adverb, or, in the case of auxiliary predicate suffixes, verb) and modifies its properties. Then the rule that attaches the suffix applies, and relates its syntactico-semantic features to the type that prepared the root for incorporation.

All of these rules share some similarities, which I abstract into a higher type, *INCORPORATING-LEX-RULE* (66). This rule states that all incorporation rules apply to non-auxiliaries, and create verbs that are predicative, non-root, non-finite forms. The parent node will have some non-predicative subject and no modifiers.

(66)	<i>INCORPORATING-LEX-RULE</i>	$\left[\begin{array}{l} \text{VAL.SUBJ} \left\langle \left[\text{LOCAL.CAT.HEAD.PRD} \quad - \right] \right\rangle \\ \text{HEAD} \left[\begin{array}{ll} \text{verb} & \\ \text{PRD} & + \\ \text{AUX} & - \\ \text{FORM} & \text{non-root-nonfinite} \\ \text{MOD} & \langle \rangle \end{array} \right] \end{array} \right]$	
	SYNSEM.LOCAL.CAT		
	DAUGHTER		
	$\left[\text{SYNSEM.LOCAL.CAT.HEAD.AUX} \quad - \right]$		

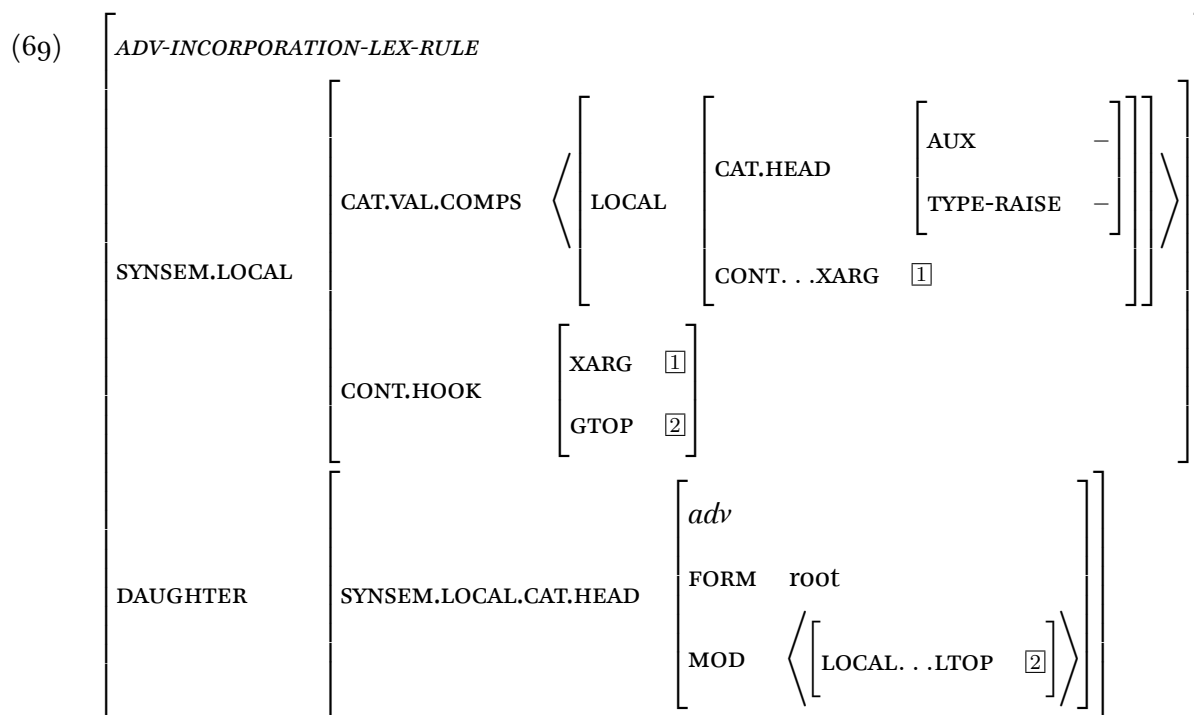

The subtypes of *INCORPORATING-LEX-RULE* that prepare nouns, adjectives, and adverbs for incorporation are given in (67, 68, 69) below.

$$(67) \left[\begin{array}{l} \text{NOUN-INCORPORATION-LEX-RULE} \\ \text{SYNSEM} \left[\text{LOCAL.CAT.VAL.COMPS} \langle \rangle \right] \\ \text{DAUGHTER} \left[\text{SYNSEM.LOCAL.CAT.HEAD} \left[\begin{array}{l} \text{noun} \\ \text{FORM} \quad \text{root} \\ \text{MOD} \quad \langle \rangle \end{array} \right] \right] \end{array} \right]$$

The noun incorporation rule simply states that it needs a root form noun daughter with nothing in its modifying list, and will not have any complements.

$$(68) \left[\begin{array}{l} \text{ADJ-INCORPORATION-LEX-RULE} \\ \text{SYNSEM} \left[\text{LOCAL.CAT.VAL.COMPS} \left\langle \left[\text{LOCAL.CONT.HOOK.INDEX} \boxed{1} \right] \right\rangle \right] \\ \text{DAUGHTER} \left[\text{SYNSEM.LOCAL.CAT} \left[\begin{array}{l} \text{HEAD} \left[\begin{array}{l} \text{adj} \\ \text{FORM} \quad \text{root} \end{array} \right] \\ \text{VAL.SUBJ} \left\langle \left[\text{LOCAL} \dots \text{INDEX} \boxed{1} \right] \right\rangle \end{array} \right] \right] \end{array} \right]$$

The adjective incorporation rule states that it needs an adjective daughter, also in root form, and goes on to identify the adjective's subject's index with its own complement's index.

The adverb rule is the most complex. Parallel to the other rules, it takes a daughter that is in root form and an adverb. It inserts a value into its complements list which is not an auxiliary and not type-raised.¹⁸ It identifies the *XARG* of its complement—that is, the complement’s subject—with its own *XARG*. Since the syntactic structure of incorporated adverbs is *Adverb-SuffixVerb Object*, this *XARG* identification will, down the line, have the effect of tying the suffix verb’s subject to the (yet-to-be-added) complement’s subject.

Finally, there is the identification of the daughter’s modified element’s *LTOP* with the parent’s *GTOP*. I will admit this is a bit of a hack. Adverbs are, in MRS, “quantificationally equivalent” with what they modify. This is to allow adverbs to float in the semantic interpretation, and it is modeled with a special kind of semantic relation called a *qeq* (or quantificational equivalency) and a type called a “handle” which relates things quantifications. A simple semantic expression for ‘I only sing’ then looks like (70).

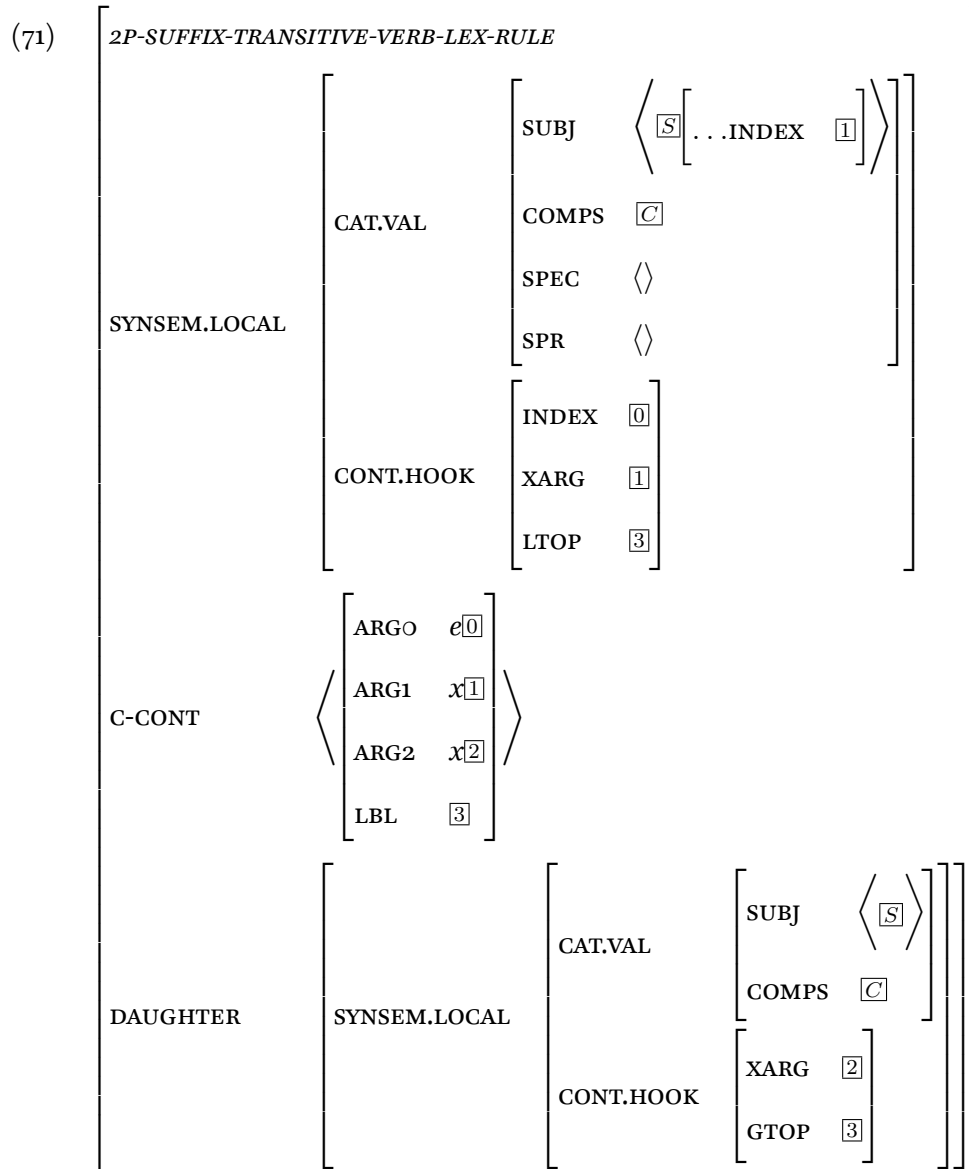

¹⁸This is important so that certain rules not mentioned, for instance intransitive-verb-to-adjective, cannot be the complement of an incorporated adverb.

$$(70) \left\langle \begin{bmatrix} ONLY \\ LBL \quad h \\ ARGO \quad e \\ ARG1 \quad h[1] \end{bmatrix}, \begin{bmatrix} SING \\ LBL \quad h[2] \\ ARGO \quad e \begin{bmatrix} TENSE \quad present \end{bmatrix} \\ ARG1 \quad x \begin{bmatrix} PERNUM \quad 1sg \end{bmatrix} \end{bmatrix}, \begin{bmatrix} QEQ \\ HIGHER \quad [1] \\ LOWER \quad [2] \end{bmatrix} \right\rangle$$

In the *ADV-INCORPORATION-LEX-RULE* (69), I need to preserve the adverb's semantic LBL value (stored in *LTOP* in the syntax) so that, when the suffix verb is attached, that LBL from its *QEQ* relation is around for me to associate with the verb. This is not what the *GTOP* value is intended for, but it works, and that *GTOP* is not associated with anything else once the suffix verb is applied, so no harm done.¹⁹

Once one of the above rules has applied, the main predicate suffix can be added. There is one rule for preparing each of the lexical categories (noun, adjective, and adverb), but there is one rule for adding suffixes, given in (71), which I will explain in detail.

¹⁹The reader may have noticed that all my rules so far are treating the suffix verbs as though they are transitive only—there is only at most one item in the *COMPS* list. However, in §3.1.4.1 I noted one ditransitive suffix verb. I do in fact parse ditransitives in my implemented grammar, but it requires parallel copies of all these incorporating rules, in order to account for a longer *COMPS* list. I pull a similar trick to the *GTOP* trick here in those rules, where I temporarily store the second complement in the intermediate rule's *SPEC*. This is not what this list is intended for, but once again, after the suffix verb applies, that list is hidden. As with all these rules, the full versions can be seen in my implemented grammar at <https://bitbucket.org/davinman/nuuchahnulth-grammar>.

This rule introduces a new semantic relation (C-CONT) that has not yet been assigned a semantic predication value. All this rule states is that it is an event (ARGO e) that relates two referents. The parent also will be an event, with its INDEX being the same as the introduced relation's ARGO. It will also inherit the relation's ARG1 as its XARG and its LBL as its LTOP (these are standard relationships for verbs).

The rule passes up its daughter's subject and complements. All of its possible daughters will minimally have a subject, defined in the parent type (66). The noun incorporation rule does not add any complements, while the adjective and adverb incorporation rules do, so a main predicate suffix applied

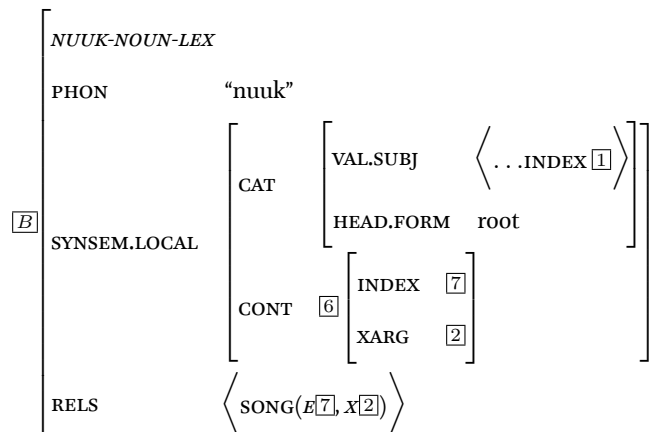

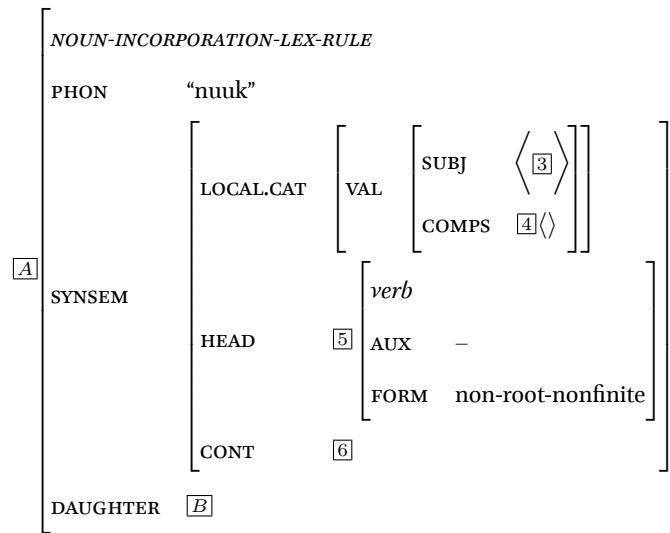

to an incorporated noun will only have a subject, while incorporated adjectives and adverbs will have an object. Finally, the new relation's LBL is identified with the daughter's G_{TOP}. This was only defined for incorporating adverbs, and this will have the effect of allowing the adverb to scope over the verb in the semantics.

All that is missing is the new relation's predication value, the small-caps symbol that indicates what meaning is. For instance, the suffix *-na·k* inherits from the type *2P-SUFFIX-TRANSITIVE-VERB-LEX-RULE* and adds only the following:

$$(72) \left[\begin{array}{l} NA\cdot K \\ PHON \quad "-na\cdot k" \\ C-CONT \quad \left\langle \left[\begin{array}{l} PRED \quad HAVE \end{array} \right] \right\rangle \end{array} \right]$$

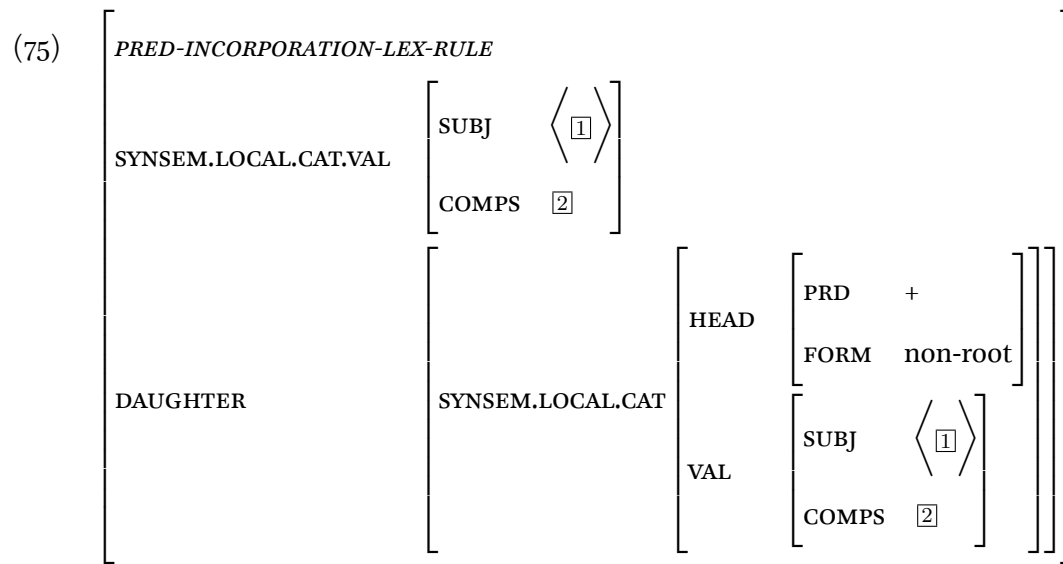

To make this more concrete, I give a derivation of the word *nuuknaak* 'have a song' in (73) below, somewhat condensed and abbreviated for space.

(73)

3.2.3.2 Auxiliary predicate suffixes

The strategy I apply to auxiliary predicate suffixes is extremely similar to that for main predicate suffixes. Like main predicate suffixes, incorporation proceeds in two steps: first a lexical rule that moves the needed syntactic properties into place, and then a final inflecting lexical rule that supplies the suffix itself. Because auxiliary predicate suffixes handle all predicates in the same way (§3.1.4.2), I only need two “preparatory” lexical rules: one for predicates (75), and one for adverbs (76). As with the main predicate suffixes, these lexical types inherit from *INCORPORATING-LEX-RULE* (66).

This lexical rule asserts that its daughter is a predicate (a noun, adjective, or verb) and not a root form. It then passes up that word’s subject and complements.

This rule does much of the same work that the previous adverb incorporation rule does. The modifications are that, rather than identifying the complement's INDEX with the mother's XARG as in (69), the complement's INDEX is identified with the mother's INDEX. This will have the effect of allowing the adverb to modify the complement. The complement's XARG is also identified with the subject. This has the effect of generating the subject-control properties of the suffix. The rest of the structure is the same as in (69), and in fact in my implementation, the commonalities are stored in an abstract type that both daughters inherit from.

Once again, a final type applies the actual suffix verb itself, this time called *2P-SUFFIX-PRED-VERB-LEX-RULE*. This type is once again highly similar to the version seen for main predicate suffixes in (71). In fact, there is only one difference: the ARG2 of the C-CONT is an event type rather than a referent and is identified with the daughter's INDEX rather than its XARG. Other than that, the rules are identical. Again, I put the common restrictions in a supertype from which both subtypes inherit. The daughter subtype

2P-SUFFIX-PRED-VERB-LEX-RULE with the relevant changes is given in (77).

$$(77) \left[\begin{array}{l} 2P-SUFFIX-PRED-VERB-LEX-RULE \\ C-CONT \quad \left\langle \left[\begin{array}{cc} \text{ARG2} & e[2] \end{array} \right] \right\rangle \\ DAUGHTER \quad \left[\begin{array}{cc} \text{SYNSEM.LOCAL.CONT.HOOK.XARG} & [2] \end{array} \right] \end{array} \right]$$

I give a sample derivation of the word *?aanimahsa* ‘only want to’ in (78).

(78)

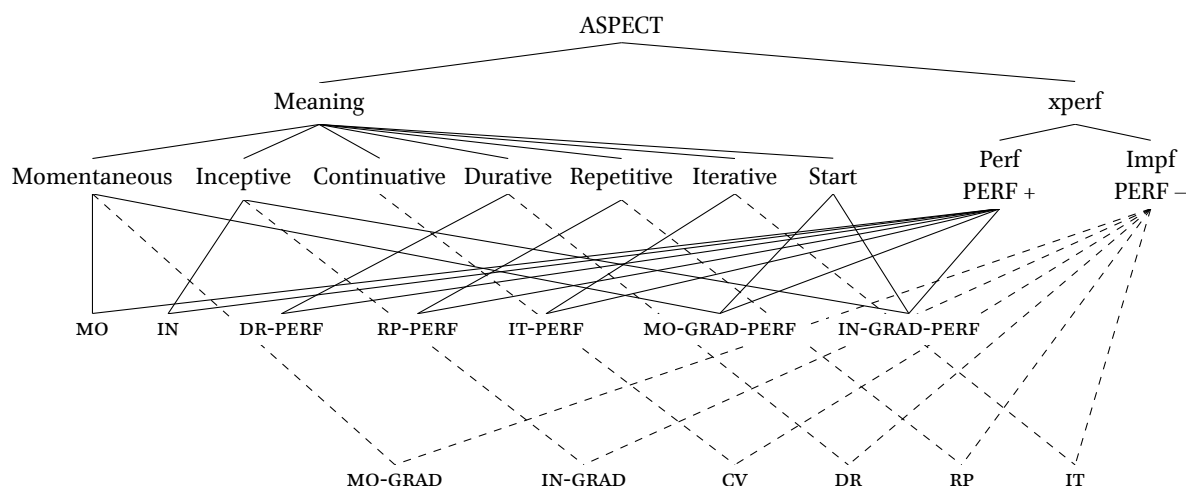

The only special care that has to be taken with λu attachment is blocking certain auxiliary suffixes from taking it, while allowing it for others. I do this by defining morphological hierarchies. Some suffixes, like *-maḥsa*, inherit from a type which underspecifies its daughter as either a predicate lexeme or λu . Others, like *-wītas*, inherit from a type which forbids its daughter to be λu .

3.2.4 Verbal aspect

As indicated in (§3.1.5), I have implemented the traditional aspect system in my analysis. This is implemented in two parts. The first is a hierarchy of aspectual forms. For each final form present in Fig. 3.1, there is a node corresponding to it. Aspect is broken into two components: Meaning (which encompasses categories like momentaneous, inceptive, repetitive, and so on), and xperf (which defines whether something is perfective or imperfective). I have added an additional type to the meaning hierarchy labeled “start,” which is meant to represent a final perfective form (in momentaneous graduable perfective and inceptive graduable perfective). This hierarchy is shown in Fig. 3.3, where all possible aspect forms (less the Iterative 2) are leaf nodes that inherit from at least one meaning subtype and one perfective subtype. Perfective types (the second from last row) inherit from Perf, and imperfective types (the last row) inherit from Impf. This will allow later parts of the grammar to refer to perfective and imperfective aspects, without having to worry about which aspect a word specifically is (4.3).

Figure 3.3: Traditional aspectual hierarchy

While this describes the aspectual forms and their properties, this is not yet a way of morphologically applying them to a root. In fact, this hierarchical description makes straightforward application impossible. The momentaneous form MO is defined as being PERF +, and the momentaneous graduative MO-GRAD is defined as being PERF -. So the aspect value MO-GRAD cannot, in this schema, apply to a lexeme that has the aspectual type MO, because a thing cannot be both PERF + and PERF -. The way I handle this is to apply suffixes and aspectual meaning in separate rules. Fig. 3.4 below shows the pathway for lexical rule applications for momentaneous-derived forms. A root can take the morphology for momentaneous and graduative forms separately from the application of the aspectual values to the verb. This prevents PERF values from clashing.

Figure 3.4: Application of morphology to momentaneous forms

3.3 Summary

Because of predicate flexibility in Nuuchahnulth, I have defined special terminology to distinguish between semantic and syntactic phenomenon. I use *relation* to refer to atomic semantic units and *argument* to refer to the variables that those semantic units relate. I refer to syntactic *predicates*, which are the position in the clause where semantic arguments may be filled. *Participants* are the syntactic units that fulfill a predicate's semantic arguments, and thus correlate with semantic *arguments*.

Verbs, adjectives, and common nouns may all be used predicatively, but proper nouns cannot be. All

of these lexical categories can be used as participants, but verbs and adjectives require an “article,” which I argue is a relativizer. Each clause is headed by a second-position inflectional element which provides, among other things, subject agreement. Adverbs may precede the clausal predicate, in which case the second position inflection appears after the adverb.

A series of suffixes may also occur in second position, but with respect to their complement and not the clause as a whole. The only two types of second position suffixes I model are main predicate suffixes, which relate two or three referents to each other (with meanings like ‘have,’ ‘take,’ and ‘give,’) and auxiliary predicate suffixes, which are subject-controlling predicates that relate a referent to an event (with meanings like ‘going to’ and ‘want to’).

Finally, I describe the complex aspect system in Nuuchahnulth, and its traditional interpretation and a proposed revised interpretation. In either interpretation, the system has a few perfective forms and a large number of imperfective forms.

All of these facts are modeled in an implemented grammar based in the HPSG formalism. The predicate/participant distinction, which is modeled through a boolean-valued feature [PRED +|-], which keeps track of the eventiveness or referentiality of the element’s semantic index. Nouns, adjectives, and verbs are all modeled as events minimally with syntactic subjects, which must go through a lexical or syntactic rule in order to be used as participants, and expose a referential index instead of an event. Second position clausal elements are modeled as syntactic words that attach to the leftmost element in the phrase, while second position suffixes are modeled as lexical incorporation. The aspectual system is modeled as a type hierarchy which separates notional meaning from perfectiveness. This requires the morphology to be added separately from the semantics of aspect. With this basic sketch of the clause and my HPSG analysis of it, I will be able to describe my understanding of serial verbs (§4) and the predicate linker (§5), and how I model these phenomena.

Chapter 4

SERIAL VERBS

In this section I will introduce what I mean when I refer to serial verb constructions (SVCs) in Nuuchahnulth (§4.1), give the data on the construction (§4.2), and finally my analysis as implemented in my grammar (§4.3).

4.1 Serial Verb Definition

To investigate the properties of serial verb constructions (SVCs) in Nuuchahnulth I first have to define what I count as such a construction in the language. I will here give my reasoning for the definition, and what I exclude from the category.

It is difficult to find a single widely accepted definition of serial verbs in the linguistic literature. Even in their typological survey, Aikhenvald & Dixon (2006) give several definitions, some of which conflict with each other. They define SVCs as multiple verbs that (i) are monoclausal; (ii) form a “single predicate”; (iii) form a “single event”; (iv) form one unit phonologically; (v) are negated singly. Most of these definitions are problematic or vague. Aikhenvald & Dixon give no clear definition for a single predicate or a single event. Without a formal semantic representation, these are left vague, and the definition of a single predicate (when it is not synonymous with a single event) seems to come down to monoclausality. While serial verbs may be phonologically connected, they give several examples where the serial verbs are separated by intervening words (such as a direct object), and give instances of serial verbs (on their definition) where one verb is negated while the other is not. So none of these definitional properties are necessary, and those that are are underdefined. This is perhaps necessary when trying to define a phenomenon across all of human language.

I am only looking at one language, Nuuchahnulth, and will tailor my definition of a serial verb construction to the language, while attempting to keep the definition as broadly applicable as possible. I will

avoid making claims about “single predicates” and “single events” without defining those terms within an analytical framework (§4.1.1). My functional definition of a serial verb construction in Nuuchahnulth is this:

- (79) Any clause containing two verbs without an overt coordinator, and where the verbs share the semantic interpretation of the second position clausal inflection is a serial verb construction.

Each matrix and dependent clause is marked with a second-position clitic, and so the boundaries of a clause are often easy to determine. The one exception to this is that the third-person neutral mood is null-marked. For this reason, I will use examples that are not in this person-mood combination. Because of the restriction that serial verb constructions lack an overt coordinator, constructions containing a linker morpheme (§5) do not count as SVCs.

The requirement of sharing the second position clausal inflection is clearly Nuuchahnulth-specific. However, it is a way to capture the distinction between a single clause with a serial verb construction and two separate clauses. The way to determine a clause boundary will differ language to language. Because clause boundaries in Nuuchahnulth include subject information, the verbs necessarily share a subject. This may be true of all SVCs, but I make no such claim here. Importantly, this definition says nothing about the semantics or event properties of a SVC, only that a serial verb construction is one where verbs relate to one another within the limits of a clause. There is room for a great deal of difference and diversity of SVCs that meet this definition, and this is by design.

4.1.1 *Semantic Compositionality*

I have an analytical preference for semantic compositionality where possible. Semantic compositionality means that one can create the semantics of the sentence directly from the semantics of lexical items and combinatoric rules in the syntax. In my analysis (§4.3) I will be able to maintain compositionality for Nuuchahnulth SVCs. This may be a result of the facts about Nuuchahnulth as well as my framework, and I make no claims about semantic compositionality in SVCs cross-linguistically.

As an example of an SVC analysis that does not maintain compositionality, I will use Butt (1995)’s analysis of Urdu serial verbs. A key component of Butt’s analysis is the notion of a “complex predicate,”

which is the creation of a new atomic unit of meaning from two separate words. The two components of a complex predicate may have a hierarchical relation in the syntax of the language (which contradicts the monoclausality requirement of Aikhenvald & Dixon (2006)), but form a new semantic unit. The semantic relation for the word ‘write’ might be $WRITE(x, y)$, but when combined with the Urdu permissive verb $LET(a, B)$, the new semantic relation is $LET-WRITE(x, y, z)$. The composed semantic relation in this case has a different number of arguments from either of its dependent relations.

Despite the apparent relationship between $WRITE$, LET , and $LET-WRITE$, this analysis, without the development of a fuller semantic formalism, violates semantic compositionality. We write a relation and its elementary predication with upper-case letters as a shorthand for the ‘meaning’ of that morpheme. However, this convention is only for human readability, since we are not actually defining what those units mean but just using them as placeholders for “whatever the proper lexical semantics are.” We could define the meaning of *write* as $MEANING_{1647}$ with no loss of specificity. Butt’s analysis creates a situation where there is a new mathematical operation in the semantic representation: ‘let’ LET + ‘write’ $WRITE$ = $LET-WRITE$. Despite the similarity in labels, there is no formal relationship between these three meaning representations except by that equation. It is just as though the equation had been $MEANING_{1647} + MEANING_{2119} = MEANING_{8780}$. Even though the meaning of Urdu’s *let-write* is semantically compositional in the language, the meaning representation of Butt’s “complex predicate” in the formalism is non-compositional with respect to its members.

This is not necessarily a bad thing in all contexts. Some sort of arbitrariness is necessary when modeling multi-word expressions like idioms, which have for a long time been understood as not fully compositional (Chafe 1968), although multi-word expressions can vary in their semantic compositionality (Nunberg et al. 1994). It is possible that many SVCs are not-quite compositional and a non-compositional semantic relation is an appropriate model. However, when this kind of rule is productive and has predictable semantics (as in the case for SVCs in Nuuchahnulth), I believe it is preferable to adhere to semantic compositionality in the formal analysis. Otherwise, one ends up with a list of semantic equations which is nearly the size of the set of verbs in the lexicon, if not larger.

In Lexical-Functional Grammar (LFG), which is the framework that Butt uses, the elementary predication (the all-caps semantic relation) of a word is linked to the number of its arguments. That is, the

meaning of ‘write’ isn’t merely WRITE, but WRITE(x, y). In LFG then, to add an argument to a relation, it is necessary to change the relation’s meaning itself, and this is what Butt does. In MRS (Copestake et al. 2005), the elementary predication and its arguments are separated from each other. That is, the meaning of ‘write’ is represented as:

$$(80) \left[\begin{array}{ll} \text{PRED} & \text{WRITE} \\ \text{ARG0} & e \\ \text{ARG1} & x \\ \text{ARG2} & y \end{array} \right]$$

This separability is something the formalism shares with Neodavidsonian representations (Parsons 1990), and will allow me to maintain strict semantic compositionality in my analysis of serial verbs in Nuuchahnulth.

4.1.2 Non-SVCs

I have defined Nuuchahnulth serial verb constructions in (79) as any clause (defined by the second position clausal enclitics) which contains more than one verb, without any overt coordinator, and where the clausal enclitics are semantically interpreted as belonging to all verbs in the construction. There are a few types of constructions that nearly fit this definition, but are excluded. The first is juxtaposed clauses (81).

- (81) hača pawałšił [pause] ʔuušpiq [pause] ʔuušpiqqača wawaa.
 hača pawał-šił ʔuušpiq ʔuušpiq=qača wawaa.
 maybe lost-MO something.bad.happens.MO something.bad.happens.MO=DUBV say.CV
 ‘“Maybe he got lost... something happened... perhaps something happened,” they said.’ (C, *tupaat* Julia Lucas)

(81) comes from a text about a man who was lost at sea and returns. Although one could claim that the first two verbs, *pawałšił* and *ʔuušpiq*, are in a SVC, the prosody used in the utterance indicates

something else. The repeated *ʔuušpiq*, complete with a second position clitic, suggests that these are clauses (the first two under null-marked third person neutral mood) that are adjacent. This kind of structure occurs in speech as people are rephrasing or redescribing an event. (82) has the same structure, and is from a description of Raven in a narrative text.

(82) ʔayiisšił, hiyiisšił haʔumukʔi.

ʔaya-!iis-šił hiš-!iis-šił haʔum=uk=ʔi
many-consume-MO all-consume-MO food=POSS=ART

‘He ate a lot, he ate all of the food.’ (B, Marjorie Touchie)

Like (81), (82) is in the third person, and I believe this is two separate clauses, and not a serialization structure. When these sorts of constructions occur outside the third person, the adjacent clauses require an overt enclitic, and so this apparent ambiguity (serialization vs adjacent clause) does not occur.

The second kind of construction that falls outside my definition of a SVC is temporal expressions. The way to express a duration of time is to juxtapose the time period with the rest of the clause. If the time expression is in the durative aspect, the interpretation is ‘for *x* time’ (83). If the time expression is in a perfective aspect, the interpretation is ‘after *x* time’ or ‘at the end of *x* time’ (84).

(83) sučačintiis hił ʔuumaʔaas.

suča-čił=int=(y)iis hił ʔuumaʔaas
five-day.DR=PST=WEAK.ISG be.at Port.Alberni

‘I was in Port Alberni for five days.’ (Q, Sophie Billy)

(84) ʔaḥʔaaʔałqača nupqʔičḥšiʔeł ʔaacsaał ḥiškʷiiʔaḥ ʔapac hintšił ʔuucayuk ḥiškʷiiʔaḥ.

ʔaḥʔaaʔał=qača nup-qʔičḥ-šił=!ał ʔaacs=!ał ḥiškʷiiʔaḥ ʔapac hintšił
and=DUBV one-year.DR-MO=NOW see=NOW Hesquiaht canoe arrive.MO.GR

ʔu-L.cayuk ḥiškʷiiʔaḥ

x-go.DR Hesquiaht

‘And one year later the Hesquiahts saw a boat arriving toward Hesquiaht.’ (C, *tupaat* Julia Lucas)

Although these two types of temporal expression are distinct, it is possible to use the second construction, which uses a perfective form, to express a duration, i.e. *it has become X length of time that Y has been done*, as in 85. The opposite (interpreting the durative form to mean ‘after’) is not possible to my knowledge.

(85) ʔahʔaaʔaʔ muučiiłšĩna hił siya ʔahʔaaʔaʔ haakʷaaʔuk Matthew, kʷaaʔuucukqs.

ʔahʔaaʔaʔ muu-čiʔ-ł-šĩna=naʔ hił siya ʔahʔaaʔaʔ haakʷaaʔuk=uk Matthew
and four-day.DR-MO=NEUT.1PL be.at 1SG and young.girl=POSS Matthew
kʷaaʔuuc=uk=qs
grandchild=POSS=DEFN.1SG

‘We were there for four days, me and Matthew’s daughter, my granddaughter.’ (C, *tupaat* Julia Lucas)

What differentiates these expressions from serial verb constructions, as well as linker constructions (see §5) is the interpretation of the subject. While the temporal component can take the subject-mood portmanteau (83, 85), the person expressed in the subject clitic is not in any way the subject of the temporal expression. In (83), ‘I’ is not the subject of ‘five days.’ This is also the case for the subjects of the verbs in (84, 85). Instead, the time expression seems to be opaque to the subject information present in the clause. So while this construction does have two verbs in a single clause, the interpretive scope of the second position enclitics only falls on one of the verbs (the non-temporal one), and this type of construction is excluded from my scope for serial verbs.

4.2 Data

4.2.1 Types of Serial Verb Constructions

Descriptively, I have categorized observed serial verb constructions into four types. These types are not motivated a priori by any external typological theories or a commitment to these categories, but an attempt to make sense of my data, and in my analysis (§4.3) I will collapse Types I-III into the same analytical type, but I leave them separated here in an attempt to maintain a distinction between data

and analysis.

4.2.1.1 Type I: Simultaneity

This SVC links two verbs together that necessarily occur simultaneously. Semantically, they can often be described loosely as “manner and action”—where one verb is expressing the main action, and another is expressing how it is done. This includes motion and manner of motion (e.g., go + walk as in 86), a semantically light verb like “do” coordinating with the actual action (e.g., only-do + lie-down as in 87), and metaphoric motion and action (e.g., go-back + become-alive as in 88).

huʔa-ca-čiš=!aaqʔ=suuk tiič-°aciš
 back-go-MO=FUT=NEUT.2PL live-IN
 ‘You will come back to life.’ (C, tupaat Julia Lucas)

However, this construction is not limited to the semantics of “manner and motion.” Speakers can also coordinate verbs that describe resultative and simultaneous actions (e.g., feel sorry for + mistreat as in 89), or what I sometimes call serial repetition, which includes cases where a transitive and intransitive verb are both used to express an action (e.g., eat + eat in 90, and cry + cry for in 91), or where two transitive

verbs, one more specific and less specific, are used (e.g., say + talk about in 92). The only unifying property of these SVCs seems to be simultaneity.

I noticed in the course of working on this dissertation that this type of SVC have a strong tendency to agree in perfectiveness. For an overview of Nuuchahnulth's aspect system, I refer back to §3.1.5. Here I will simply say that verb forms that end in the "inceptive" or "momentaneous" aspect are perfective, while all other forms are imperfective.

Despite my belief that there is a preference for aspectual matching, speakers were often very flexible on the grammaticality of perfective mismatching when asked about it directly. I made several attempts to suss out whether this was a grammatical rule in one-on-one sessions with speakers, but often received contradicting information. I will first present data from running texts. These texts come from a number of sources: (1) Sapir & Swadesh (1939); (2) Texts gathered by Adam Werle and provided to me (some from speakers I have not worked with and some I have); (3) Texts I elicited with speakers. Some of these were texts I have interlinearized and some I have not.

I went through these texts and marked instances of what I believed to be SVCs. Because a large number of cases in running text are third person, and thus possibly involve more than one clause with a null-marked third person, I had to make educated guesses about whether some third-person constructions were two clauses or a SVC. I used a few tells: (i) the presence or absence of overt (non-neutral) third-person inflection in the surrounding text; (ii) whether the verbs share an (overt) object; (iii) whether the verbs are in an embedded clause. I ranked possible SVCs on a confidence level of 1-4, with 1 being uncertain, 2 a toss-up, 3 likely, and 4 completely positive. I then counted how many times the two verbs in the SVC matched or mismatched in perfectivity. For a few cases (see below) I was uncertain about the perfectivity of one of the verbs and gave it a score of 0.5. I then threw away all SVCs ranked as 1s and 2s. The remaining data are presented in Table 4.1 below. I have broken this data into five sections: Data from the Nootka Texts, which is roughly 100 year old Tseshaht Nuuchahnulth, and then one for each of the modern dialect regions (Barkley, Central, Northern, and Kyuquot-Checlesheht). The majority of the Central data comes from my consultant Julia Lucas, and the majority of the Kyuquot-Checlesheht data comes from an in-progress Bible translation from Sophie Billy. I lumped these together with other smaller sources, which (from my limited data) appear to have similar broad characteristics.

Table 4.1: Type 1 SVCs and Perfectivity

	Word count	Type 1 SVCs	Perfectivity mismatches
Nootka Texts	2220	22	1
Barkley speakers	942	10	3
Central speakers	2456	26	9.5
Northern speakers	1621	12	3.5
Kyuquot-Checlesheht speakers	6928	36	11

Perfectivity mismatches almost do not occur in my sampling of the Nootka Texts. The 1 count comes from 2 cases that were given a 0.5. The first is due to the verb *ʔuhtinʔap* ‘make out of’, which appears to be made with the imperfective form of the suffix *-htin* ‘made of’, but could plausibly be interpreted as perfective, which then coordinates with perfective *ʔukʷitšič̓*. Another case was given a 0.5 count

because it coordinated the verb *q^wis* ‘do thusly’ with *ħaʔuk^wił* ‘do in return’ (perfective).² It is possible to interpret *q^wis* as imperfective (there is a clear perfective *q^wisš*i*ł*), but it is also possible that this kind of semantically bleached word ‘do thus’ is in a different kind of relationship with the following verb and not a SVC.

Mismatches are much more common among modern speakers, occurring about a third of the time. Many of these cases share some common features: 5 include the imperfective verb *hiniic* ‘carry’ coordinated with a perfective verb of motion; 3 include imperfective *ʔucaap* ‘put’ coordinated with a perfective verb of motion; and 2 include imperfective *ʔuk^wił* with a perfective verb. I single out these cases because they are cases where the corresponding perfective forms, *hiniicš*i*ł*, *ʔucayap*, and *ʔuk^wiłš*i*ł* are quite rare, and these may be lexical exceptions to perfectivity matching (see §4.2.1.2 and §4.2.1.3). This accounts for half of the mismatching cases. The remaining set are not divided lexically, and are mostly various motion verbs mismatching with one another: imperfective *ʔuyiiq* ‘be in a canoe’ and perfective *wataak* ‘go’ (Bob Mundy, Barkley dialect); perfective *ʔucač*i*ł* ‘go’ and imperfective *łatwaa* ‘paddle’ (Julia Lucas, Central dialect); perfective *watš*i*ł* ‘go home’ and imperfective *kamitqk^w* ‘run’ (Sophie Billy, Kyuquot-Checlesheht dialect); and so on. It is significant that mismatches of this type do not occur in any of the Nootka Texts I annotated. My interpretation of these distributive facts is that there was either a grammatical requirement or grammatical preference in the past for a serial verb construction to have matching perfectivity, but in the present status of the language that preference has significantly relaxed.

In an attempt to directly confirm this perfectivity preference, I put together a short set of standard forced-choice tests, which included perfectiveness matching, to see if speakers would choose matching verb forms or non-matching verbs. The results were mixed, and I believe this is partly due to cultural factors making this kind of test difficult in the language and also from the test itself. Speaker responses were different in this out-of-the-blue forced choice from their responses when working with sentences presented in context. A detailed discussion of this forced-choice test is given in Appendix C.1.

In elicitation sessions where sentences were situated within a given context, a stronger preference for perfectivity matching did in fact emerge. This happened in two ways: Speakers typically rejected

²This exact same construction *q^wis* + *ħaʔuk^wił* also appears in a text from Earl Smith, a Northern dialect speaker, and so may also be a formulaic expression.

a rephrasing of matched perfectivity sentences that used mismatched perfectivity, and speakers (when ruminating on a sentence) would repeat it until they reached matching perfectivity, and say, “Yes, that’s the best way to put it.” This is consistent with my interpretation that the perfectivity requirement is an older component of the grammar that has relaxed in the modern language.

In (97), a sentence that was provided initially by my consultant. the two verbs are both in the durative aspect. In the ungrammatical (98), which I suggested, the second verb has been moved to the momentaneous, which is a perfective aspect, and mismatches with the first verb, which remains in an imperfective aspect.

(97) ʔuuciʔukwitas yuuhuʔiʔath yaacuk.

go.DR-going.to=STRG.1SG Ucluelet walk.MO

Intended: ‘I’m going to walk to Ucluelet.’ (C, *tupaat* Julia Lucas)

In another context, the same consultant Julia Lucas had the precisely opposite judgment of perfectivity mismatching. (99, 100) below are a near inversion of (97, 98) above. The verb ‘go’ is second, rather than first, in the construction, and the clause is in the future tense with =!aqʔ rather than the modal intentional future -witas. When Julia rejected (100) she said, “No, *yaacuk* because you are on your way.”

eat.DR-MO=NOW=REAL.1PL X-eat-MO spring.salmon

'We start eating spring salmon.' (B, Marjorie Touchie)

My interpretation of this apparently contradictory data is this: perfective aspect on 'going' verbs is dispreferred in the future tense, because the typical interpretation of perfectivity is that an action is completed. This helps explain the grammaticality judgments in (99, 100), although it doesn't do anything to explain why the verb *λiihšič̣* is in a perfective aspect. Without this complication of tense, as in (97, 98), a preference for perfectivity matching can emerge, although this is no longer an absolute preference

(Table 4.1). Requirements of perfectivity matching are eroding, and preferences on verbs of motion are the least strict.

Sensitivity to perfectivity matching also varied by consultant. Fidelia Haiyupis consistently produced sentences grammaticality judgments in preference of perfectivity matching. Even in cases like (104) below, which I suggested, she responded that it was fine, and then rephrased it to (105).

'I was walking to the lake.' (N, Fidelia Haiyupis)

For one of my consultants, Sophie Billy, who is the youngest speaker and the only Checkleseht speaker I worked with, there was absolutely no preference for perfectivity matching in her speech. This could be a property of Kyuquot-Checkleseht, her generation, or her idiolect, and I have no way of knowing. In elicitation sessions, she would productively produce matching (106) and mismatching (107) SVCs, and I was unable to get any strong judgments from her in rewording tests.

 ‘I’m going to walk home.’ (Q, Sophie Billy)

4.2.1.2 II. Location and Action

Most descriptive locations in Nuuchahnulth are verbs, ‘be at a place’ and locations are simply juxtaposed with the action performed there. This strategy is used for transitive *hit* ‘be at’ as well as intransitive locations like *hitaas* or *ḷaaʔaas* ‘be outside’ and *hitingis* ‘be at the beach.’

- (108) hiļʔii wiinapuļ.
 hiļ=liʔ wiinapuļ
 be.at=CMMD.2SG stop.MO

- (111) hiłqiiʔaʎin ʎaacsiičiʎ čums nučii.

hił-qii=!aʎ=in ʎaacs-a-i·čiʎ čums nuč-i·
be.at-on.top=NOW=WEAK.1PL see.CV-IN bear mountain-NMLZ

‘We saw a bear (we being) on top of the mountain.’ (N, Fidelia Haiyupis)

Unlike Type I SVCs, there does not appear to be a requirement that the verbs match in their aspect. This is partly because most locatives do not inflect for aspect. For the basic verb *hił* ‘be at’ there is no perfective form of **hiłšiʎ* or **hiłiičiʎ*, and *hił* can serialize with both perfective (108) and imperfective verbs (110). There exist perfective forms for some of the other location words, for instance *hitingsaʎ* ‘go to the beach’ from *hitingis* ‘be at the beach.’ However, there is still no requirement for aspectual agreement here, as these location verbs can serialize with both perfective (111) and imperfective verbs (109).

Unlike Type I verbs, there is a strong ordering preference. The location verb must come before the action verb (112, 113).

'Go yell outside.' (N, Fidelia Haiyupis)

(117) *nunuukči λaa?aas.

nunuuk=či λaa?aas
sing.DR=CMGO.2SG outside

Intended: 'Go sing outside.'³ (N, Fidelia Haiyupis)

There are some cases where the location word *hił* 'be at' appears as the second verb in a construction. I believe that in these cases there is something different going on: location verbs may also head a modifying phrase. This construction is quite rare and was difficult to elicit. I only have a few examples of it being used by Julia Lucas in my texts. (118, 119) show two examples where the phrase *hił ʔaaḥuus?ath* 'being at Ahousaht' behaves as a modifying element of a verb.

(118) ʔuyimitʔiśʔaałʔał ʔahʔaa tuupšiʔeλquu hił ʔaaḥuus?ath.

ʔuyi=(m)it=ʔiś=ʔaał=ʔał ʔahʔaa tuupšiλ=!aλ=quu hił ʔaaḥuus?ath
and.then=PST=STRG.3=HAB=PL DTOP get.dark.MO=NOW=PSSB.3 be.at Ahousaht.

'It was when it would get dark at Ahousaht.' (C, *tupaat* Julia Lucas)

³(117) can be "saved" by adding a linker to the location, i.e. *nunuukči λaa?aash*. This creates a new type of construction, which I will discuss in §5.

- (119) ʔahʔaaʔaʕqač̣a ʔiškʷiiʔath hinin hiʔ ʕaaʔuusʔath.
 ʔahʔaaʔaʕ=qač̣a ʔiškʷiiʔath hinin hiʔ ʕaaʔuusʔath
 and.then=DUBV.3 Hesquiaht arrive.MO be.at Ahousaht.
 ‘And then the Hesquiahts would arrive at Ahousaht.’ (C, *tupaat* Julia Lucas)

This construction also occurs in the Nootka Texts, although it also appears to be quite rare. (120) shows the modificational phrase *hiʔ ʔanaʔʔis č̣apac* ‘at a small canoe.’

- (120) weʔič̣aʔsʔaʕ kʷalsic hiʔ ʔanaʔʔis č̣apac ʔathii.
 weʔič̣-laʔs=laʕ kʷalsic hiʔ ʔanaʔʔis č̣apac ʔathii
 sleep.DR-in.a.vessel=NOW Kwalisits be.at size=DIM canoe night.
 ‘Kwalisits was sleeping in his little canoe through the night.’ (B, Tom Sayaachapis, (Sapir 1924:3))

Despite this special case of the word *hiʔ*, speakers are able to articulate their preference for location-first SVCs. Several consultants explained that a sentence “Sounds better when you say where it’s happening first.”

This restriction on location-action serialization can be interpreted as a grammaticalization of a larger preference in Nuuchahnulth for modifying expressions to precede what they modify. For instance, adverbs will preferentially precede the verb (and speakers will correct themselves and others by moving adverbs before to a verb). The preference for location-first SVCs appears to be stronger and more absolute than the adverb-first preference, and I interpret it as a grammatical rule.

4.2.1.3 III. Adposition-like verbs

A fuller discussion of adposition-like words will have to wait for §5.2.3. It is enough here to mention that, according to the analysis in (Woo 2007), a series of words with meanings that in English are expressed with prepositions are, in Nuuchahnulth, expressed with verbs (121, 122). This includes verbs with commative, benefactive, and instrumentive meanings. These constructions have the same prop-

erty of the above SVCs, where an intransitive verb may “interrupt” a transitive verb (in this case, the adposition-like verb) and its object (123).

- (121) hiinasiłayaʔiš haawacsacumʔi ʔuułhwał kʷaacsacum.

hina-a·sił-LS.aya=ʔi·š haawacsacum=ʔi· ʔu-L.hwał kʷaacsacum

‘I’m going with my younger sister to Campbell River.’ (C, *tupaat* Julia Lucas)

- (123) ʔuchins mamuuk Trudeau.

ʔu-čin=s mamuuk Trudeau
x-do.for=STRG.1SG work.DR Trudeau

‘I’m working for Trudeau.’ (N, Fidelia Haiyupis)

Like Type II SVCs, adposition-like verbs freely serialize with both perfective (122, 124) and imperfective verbs (121, 123). Unlike Type I and II SVCs, the “interrupting verb phrase” cannot be a transitive verb with an argument.

- (124) ʔucačiʔaλukʷitaḥ taṇeʔis cuumaʃas ʔukʷink yaaqsčafinʔitq.

ʔu-ca-čič=!aλ=uk=(m)it=(m)a·ḥ taṇa=ʔis cuumaʃas ʔu-(č)ink yaq-L.(k)sčafin=ʔi·tq
x-go-MO=NOW=POSS=PST=REAL.1SG child=DIM Port.Alberni x-with who-friendly=DEFN.3

‘My child went to Port Alberni with his friend.’ (B, Bob Mundy)

- (125) *ʔuk^wink^aʔuk^wita^h ʔucači^l ta^{ne}ʔis yaaqsč^afin^ʔitq.

ʔu-(č)ink=[!]a^l=uk=(m)it=(m)a^{·h} ʔu-ca-či^l ta^{na}=ʔis yaq-L.(k)sč^afin=^ʔi^{·tq}

x-with=NOW=POSS=PST=REAL.1SG x-go-MO child=DIM who-friendly=DEFN.3

Intended: 'My child went with his friend.' (B, Bob Mundy)

Like Type II SVCs, some of these verbs have perfective forms (126, 127, 128, 129). As with the non-perfective forms, there is still no requirement for perfectivity matching (126, 127).

- (126) ʔa^hs ʔuč^hinči^l mamuuk.

'I'm going to go with my older sister to Tofino.' (C, *tupaat* Julia Lucas)

- (129) ʔuu^hwa^lši^lma^ʔa^l muuna.

ʔu-L.^hwa^l-ši^l=ma^{·ʔ}a^l muuna

x-use-MO=REAL.3=PL motor

'They started using motors.' (B, Bob Mundy)

In sum, Type III serialization in my hierarchy involves two verbs, one of which expresses an adposition-like meaning. They are like Type II location serializations in that there is no requirement that the verbs match in perfectiveness. But they are different in that there is no ordering preference, and only one word at most can interrupt an adposition-like verb and its object.

4.2.1.4 IV. Sequential or Separable Action

In all the above types of serialization, the verbs are describing in some way “the same action” or something that is at least simultaneous. When Aikhenvald & Dixon (2006) talk about serial verbs describing the “same event” I believe this is an attempt to capture the sort of unity seen in these (and other) types of serialization. When I model the semantics of these constructions (§4.3) I will preserve compositionality and thus the different verbs will each have separate semantic event variables, and so they are not the “same event” in this formal way. But in all these SVCs there is, at minimum, some kind of “meanwhile” interpretation applied to the two verbs, and this is not insignificant. When I turn to the modeling, I will have to introduce a separate semantic relation for this “meanwhile” component.

The sequential/separable action subtype of SVC is different from the other serialization types. In these constructions, there is no interpretation of simultaneity and there is sometimes a (perhaps pragmatic) interpretation of sequentiality. For instance, (130) is from an exhortative text, and immediately follows the command “Don’t throw your clothes on the floor.”

- (130) suk^{wiʔi} kašsaap
 su-k^{wiʔ}=!i^r k^ʔaš-sa^rp
 hold-MO=CMMD.2SG put.away-MO.CAUS
 ‘Take it and put it away.’ (C, *tupaat* Julia Lucas)

When presented with a possible reordering (131), my consultant said it was in the wrong order, and didn’t make sense.

- (131) # kʰaʂsaapɪ sukʷiʂ
 kʰaʂ-sa·p=li· su-kʷiʂ
 put.away-MO.CAUS=CMMD.2SG hold-MO
 # ‘Put it away, then take it.’ (C, *tupaat* Julia Lucas)

This ordering effect is apparent in other constructions where one action leads to another. (132) was a sentence given by a consultant, and when I asked about (133) her response was that it sounded backwards.

- (132) ʔucičɪʔim pankuupaa ʔakʂiʂ siičɪl.
 ʔu-ci-čɪʂ=lim pankuupaa ʔak-ʂiʂ si-L.(č)ɪl
 x-go.to-MO=CMFU.2SG Vancouver appear-MO 1SG-do.to
 ‘Come to Vancouver and see me.’ (Q, Sophie Billy)
- (133) # siičɪl ʔucičʂ pankuupaa.
 ʔak-ʂiʂ=lim si-L.(č)ɪl ʔu-ci-čʂ pankuupaa
 appear-MO=CMFU.2SG 1SG-do.to x-go.to-MO Vancouver
 # ‘See me and come to Vancouver.’ (Q, Sophie Billy)

[[TODO: Pick up here]]

This construction can also be used to describe planning actions (134) or giving formal instructions to children (135).⁴

- (134) ʂiptqʂiʔin kʰanisʔakukqin wʰaʂaak hitinqisʔi.
 ʂiptq-ʂiʂ=lin kʰan-ʰis-ʔak=uk=qin wʰaʂaak hitinqis=ʔi·
 pack-MO=CMMD.1SG camp-at.beach.DR-for=POSS=DEFN.1SG go.to.MO at.beach=ART
 ‘Let’s pack our camping stuff and go to the beach.’ (B, Marjorie Touchie)

⁴The syntax of (135) is a little bit strange. However, I am confident that my consultant believed it was grammatical, even if phrased a little oddly.

(135) naʔaataḥʔatmaʔaala nunuukʔi ʔaacs a huyaalʔi.

naʔaataḥ=!at=maʔ=ʔaala nunuuk=ʔiʔ ʔaacs a huyaal=ʔiʔ

listen=PASS=REAL.3=HABIT sing=ART see.DR dance.DR=ART

‘One listens to the singing and watches the dancing.’ (B, Marjorie Touchie)

The sequential interpretation of (135) is not required: it is possible (indeed, likely) that the children will be watching dancers and listening to singing at the same time. This sentence can be used to describe both eventualities: listening to a song, followed by watching dancing, or listening while also watching.

As with other SVCs, it is possible to get more than two verbs in this construction.

(136) naʔaath i ʔaacuuḥ huuhʔtikšiiḥ.

naʔaath=ʔiʔ ʔaacuuḥ huuhʔtikšiiḥ

listen.DR=CMMD.2SG watch.DR learn.MO

‘Listen, watch, and learn.’ (Q, Sophie Billy)

There is no requirement on perfectivity matching, which makes sense if this SVC has a sequential (or at least, not necessarily simultaneous) interpretation. The examples below show the verbs in this construction disagreeing (137) and then agreeing (138) in aspect. There is a slight difference in meaning.

(137) ʔuʔukʷaqḥʔi ʔiptqš iḥ hiniic mučičʔup.

ʔuʔukʷaqḥ=!iʔ ʔiptq-š iḥ hina-iic mučičʔ-(s)tuʔp

on.your.own=CMMD.2SG pack-MO EMPTY-carry.DR clothing-kind

‘Pack and carry your own clothes.’ (C, *tupaat* Julia Lucas)

(138) ʔuʔukʷaqḥʔi ʔiptqš iḥ hiniicš iḥ mučičʔup.

ʔuʔukʷaqḥ=!iʔ ʔiptq-š iḥ hina-iic-š iḥ mučičʔ-(s)tuʔp

on.your.own=CMMD.2SG pack-MO EMPTY-carry-MO clothing-kind

‘Pack and take along your own clothes.’ (C, *tupaat* Julia Lucas)

Type V SVCs do not allow VPs to be interrupted, as seen in Types I-IV. The context for (139–141) is sitting outside, eating a picnic that you brought in a pail. A dog comes to eat your food, you pick up your food and chase it off. The context entails an ordering of the actions (first picking up the bucket, then chasing away the dog), but it is possible to give the verbs in either ordering, (139) was suggested by my consultant, and I suggested (140) and (141).

(139) *cassaaps ʕiniiʕ čax^waciis.*

cas-sa^p=s ʕiniiʕ čax^wac-iis
chase-MO.CAUS=STRG.1SG dog bucket-hold.DR

‘I chased the dog, (I) carrying the bucket.’ (C, *tupaat* Julia Lucas)

(140) *čax^waciicsiš cassaap ʕiniiʕ.*

čax^wac-iic=siš cas-sa^p ʕiniiʕ
bucket-hold.DR=STRG.1SG chase-MO.CAUS dog

‘Carrying the bucket, I chased the dog.’ (C, *tupaat* Julia Lucas)

(141) **cassaaps čax^waciis ʕiniiʕ.*

cas-sa^p=s čax^wac-iis ʕiniiʕ
chase-MO.CAUS=STRG.1SG bucket-hold.DR dog

Intended: ‘Carrying the bucket, I chased the dog.’ (C, *tupaat* Julia Lucas)

(142) and (143) are a minimal pair showing the same kind of judgment from speaker Sophie Billy, where in (143) there is a “typical” (to Type I-III) V1 VP2 Obj1 structure. Much like (139–141), despite the verb of motion ‘go’ and the action ‘carry’, this is not a Type 1 construction but carries an pragmatic assumption about ordering. Sophie consistently translated *hiniic patqukkqs* as ‘get my luggage,’ and as a preparatory step for moving to Vancouver. The interpretation of (142) is sequential action: First carry one’s things, then go to Vancouver.

(142) *hiniic̓łintiis patqukkqs ʔucič̓ł Vancouver.*

hina-iic=!aλ=int=(y)iis ʔu-ci-č̓ł Vancouver patquk=uk=qa’s
 EMPTY-carry=NOW=PST=WEAK.1SG X-go-MO Vancouver baggage=POSS=DEFN.1SG
 Intended: ‘I carried my belongings and went to Vancouver.’ (Q, Sophie Billie)

4.2.1.5 Summary and overview of SVC Types

I have defined four different types of serial verb constructions, all with slightly different properties. These properties are summarized in Table 4.2. The one issue not cleanly summarized is perfectivity matching, which seems to historically have been necessary for Type I SVCs, but is either being lost or changed in the modern grammar.

Table 4.2: Summary of SVC Types

	Description	Perfectivity matching	Verb-object splitting	Ordering restriction
Type I	Simultaneous	(✓)	✓	None
Type II	Location	✗	✓	Location first
Type III	Adposition-like	✗	✓	None
Type IV	Separable / Sequential	✗	✗	Temporal ordering

Finally, there are a things true about all SVCs. Cross-serial dependencies are never possible, as illustrated in (144, 145).

⁵Sophie used the word ‘pack’ here, which I have changed to carry. It is a feature of Vancouver Island English that the word *pack* can mean both to put materials into a suitcase, and also to carry luggage on one’s back. From my understanding of the word *hiniic* I believe the semantics of *pack* here align more closely with Standard English *carry*.

- (144) ʔuuḥwáʔiṣ kʷaacsáćum ʕamaasiḥ haawácsaćumʔi.

 x-use=STRG.3 climb.MO chair table=ART
 Intended: ‘Using a chair he climbed onto the table.’ (C, *tupaat* Julia Lucas)

More than one type of serialization can cooccur in a clause. (146) is an example of Type IV (separable action) serialization and Type III (adposition-like) serialization in a single clause. As in the English, it is not obvious from the sentence alone whether the adposition is scoping over both the previous verbs or just one, but for now it is sufficient to note that one type of serialization does not preclude later forms from attaching.

- (146) ʕiptqšʔi hiniic mućičtup ʔuuʔatup ʔumʔi.

 pack-MO=CMMD.2SG EMPTY-carry clothing-stuff do.for your.mother
 ‘Pack and carry clothes for your mother.’ (C, *tupaat* Julia Lucas)

4.2.2 Interaction with Valency Changing Operations

These serialization strategies can all interact with operations that change the verb’s valency: in Nuuchahnulth the most common of these are the causative, the passive, and the possessor (under “possessor raising,” Braithwaite 2003). What is unique about these three morphemes in Nuuchahnulth is that they are all part of the second position clausal clitic complex, which normally attaches to the first word of a clause and scopes over the clause as a whole. This makes their interaction with SVCs interesting and

not a priori predictable. Does the valency operation affect both verbs in the SVC, or does it target just one? Leaving the possessor construction aside, I turn to that question now.

All serialization strategies may have the causative attach to and affect the valence of one verb and not the other, as shown in (147) (Type I), where the causative only affects the semantics of the verb *ca* ‘go’ and not to the verb *łičił* ‘shoot’. The same kind of construction occurs with *walaakap* ‘make go’ in (148). In these examples, the causative is *not* in the clausal second position complex, but appears lower down on the verb whose valency it modifies.

(147) ʔahʔaaʔałna łičił ʔucaap ɣaa hupałʔi.

ʔahʔaaʔał=naʔ łi-čił ʔucaap ɣaa hupał=ʔiʔ
and.then=NEUT.1PL shoot-MO make.go.to D3 sun.or.moon=ART

EMPTY-carry=CMMD.2SG youngest.sibling=POSS=DEFN.2SG school go=CAUS
‘Take your younger brother to school.’ (B, Bob Mundy)

I attempted to get interpretations from speakers where one causative was interpreted on two verbs in a serial verb construction, and this was unsuccessful. It is possible that I did not find the right context, but I now believe that in SVCs the causative morpheme scopes narrowly over the verb it attaches to. I have already shown an example where a causative morpheme applies to the first verb in a sequence, but not the second (139), which is repeated in (149) below for convenience. It is also the case that when both verbs have a causative interpretation, speakers will use the causative on both verbs.

(149) cassaaps ɣiniił čax^waciis.

cas-saʔp=s ɣiniił čax^wac-iis
chase-MO.CAUS=STRG.1SG dog bucket-hold.DR

(151) haptsaapint ʔucaap hiłaayilk^w.

hapt-sa·p=int ʔu-ca=!ap hił-aayil=uk
 hide-MO.CAUS=PST x-go=CAUS be.at-above=POSS
 ‘She hid them on her roof.’ (Q, Sophie Billy)

I have already given an example where the passive scopes over both verbs in an SVC while appearing singly, in (135). However this was a case where the passive morpheme is being used to indicate generic action (“what one does”) as a command. When the passive morpheme is used to change valence properties, the pattern is identical to the causative and it appears to scope narrowly over the verb in a SVC. This can be seen when one of the verbs is intransitive, as in (152)⁷ and with two transitive verbs, where one receives a passive interpretation and the other does not, as in (153).

(152) ʔuḥʔats ʕiniiλ λawiičiʔat kamatquk.

ʔuḥ=!at=s ʕiniiλ λaw-i·čiλ=!at kamatq-uk

 and.then=NEUT.1SG again see.CV-IN grizzly.bear use=PASS grizzly.bear-inside.DR-LINK
 ‘And again I saw a grizzly bear used, a grizzly bear indoors.’ (C, *tupaat* Julia Lucas)

⁶The normal word for a seaserpent scale is čipałmis (see Sapir & Swadesh 1939 p. 281). However, Julia Lucas insists that for her it is čipatmił.

⁷In (152) the passive also appears on the clefting copula ʔuḥ. Voice agreement is a required feature of clefts.

Causative and passive morphemes in SVCs scope narrowly over the verb they modify. This contradicts an earlier observation that these morphemes are in the clausal second position (§3.1.3). That earlier claim is dependent on the observation that these clitic elements move to adverbs that precede the main predicate. My modified analysis based on evidence from serial verb constructions is that the serial verb constructions (as here defined) coordinate clauses that contain everything except subject and mood information. The coordinated elements may be small clauses themselves that contain non-mood, non-subject enclitics. So in an SVC, enclitics like the causative and passive only modify their particular coordinated clause, and not the entire structure. This concept of a clause lacking subject and mood information, and thus smaller than the clause which has those elements, will come up again in §5.

4.2.3 *Summary*

I have used a particular definition of serial verb constructions (SVCs) in Nuuchahnulth that attempts to capture a family of phenomena while making the minimum number of assumptions: Any clause that contains two verbs without a coordinator, and where one verb is not clearly subordinating the other, is a serial verb construction. I have further broken this construction type into four subtypes: (I) simultaneous SVC, (II) location SVC, (III) adposition-like SVC, (IV) separable or sequential SVC. Type I historically requires aspectual agreement of the verbs involved, although this requirement appears to have loosened for modern speakers. Types II–IV do not require aspectual agreement. Type II requires that locations occur as the first element. Types I–III allow for a verb to be separated from its object (e.g., Verb₁ Verb₂ Verb₁-Obj), while type IV disallows this kind of verb-object separation. Causative and passive morphology narrowly affect the verb in the SVC that they attach to. Together with the fact that this morphology will attach to preceding adverbs, I take this as evidence that there is a syntactic phrase in-between the verb phrase and a fully inflected clause. This intermediate element is a clause that lacks subject and mood, and it is the type of element that is coordinated in SVCs. I now turn to the analysis of this data.

4.3 *HPSG Analysis and Implementation*

Chapter 5

THE LINKER

The linker morpheme in Nuuchahnulth $-(q)h$, like serial verb constructions (§4, is a method by which the language can combine multiple verbs into a single clause. In this section I will examine how this construction behaves and its differences from serialization.

5.1 *Data*

In this section I give my collected data on the linker morpheme. I present how the construction is used and draw some conclusions about how it behaves. Like with serial verbs, I will try to keep this section fairly theory-neutral, saving the specifics of an HPSG analysis for §5.3.

The morpheme $-(q)h$ is the last possible suffix on a word. It is typically pronounced as the sequence qh following a vowel or nasal, and otherwise as h . The Central Ahousaht elder *tupaat* Julia Lucas almost always pronounces the linker as the full qh regardless of the phonological environment, with the exception of certain light verbs. I do not know if this reflects a sub-dialect of Ahousaht, or if this pronunciation is unique to her, but I transcribe her speech faithfully.

The suffix is translated as ‘meanwhile’ in Sapir & Swadesh (1939), and was first dubbed the “linker” by Adam Werle (*p.c.*), on the understanding that it “links” two predicates together. In some sense, it is coordinating two elements with each other, below the syntactic scope of the second position clitics. I will first look at the morphological attachment properties of this special coordinator (§5.1.2), followed by its syntactic properties (§5.1.3–5.1.8).

5.1.1 *Comparison with other coordination*

The linker differs from the other coordinators in the language. Various types of ‘and’ coordination are done with the word $?ah?aa?a\lambda$ and participant coordination with $?uh?i(i)\$$. These words coordinate

clauses, VPs, and participant phrases, while I will claim that the linker coordinates predicates.

Much like English *and*, the coordinator *ʔahʔaaʔaλ* may occur at the beginning or middle of a sentence. I distinguish sentence-initial and sentence-medial *ʔahʔaaʔaλ* by prosody, pause, and the presence of clausal clitics.

In its most common use at the beginning of a sentence, *ʔahʔaaʔaλ* can host the clausal clitics (154, 155) or that can be deferred to the predicate (156).

 be=PST=HABIT X-make father=POSS=PST.DEFN.1SG X-use red.cedar and line-kind
 ‘It was my dad that made it using red cedar and rope.’ (Q, Sophie Billy)

ʔahʔaaʔaλ coordinates clauses (which differ in subject), VPs (which share a subject), and participants. *ʔuhʔi(i)š* coordinates only participants. The linker, as I will argue below, coordinates a different syntactic category: predicates. As a suffix, it has a greater degree of freedom in its sites of attachment, and its scope of coordination differs from the free morpheme coordinators.

5.1.2 Attachment properties

The linker shows considerable flexibility in the stems it attaches to, attaching to nouns (162), adjectives (163), verbs (164), and adverbs (165).

- (162) ḥuucmaqḥitqačaʔaał taakšił piišmita.

[Context: My friend is going bald. I'm also going bald but I don't look in the mirror much and haven't noticed.¹]

However, the linker cannot attach complementizers (166, 167).

(166) *ʔuušcukʔisit ʔani ʔunaḥʔisitqa.*

ʔuušcuk=ʔis=(m)it ʔani ʔunaḥ=ʔis=(m)it=qa

 difficult=DIM=PST COMP-LINK small=DIM=PST=EMBD

Intended: 'It was a little difficult (to do) because it's small.' (B, Bob Mundy)

From only this data, the linker appears to distinguish morphologically between content and function categories. Another way of expressing this content/function division is by appealing to what can serve as a syntactic predicate in Nuuchahnulth (see 3). Nouns, adjectives, and verbs may all be predicative, and while adverbs are not syntactic predicates themselves, they along with their verb create a main predicate. I will return to the matter of adverbs in §5.1.7. Complementizers, on the other hand, are only connective material and cannot be the main predicate of a clause, nor can they be part of the predicative phrase. In following sections, I will refer to the predicate in linker constructions that hosts the linker as the "linked predicate" and the predicate that lacks it as the "unlinked" or "non-linked" predicate.

¹This scenario was constructed to mirror an example present in Sapir & Swadesh (1939).

5.1.3 Clause Heading

A predicate with a linker attached may not head a matrix or dependent clause. I first give some evidence on the flexibility of the relative ordering of the linker, and then examine when they are and are not allowed in matrix and dependent clauses.

In a sentence with two predicates, one with the linker and one without, the ordering does not typically make a difference.² It is possible for either predicate in an utterance to host the linker, as in (168, 169).

- (168) hitaashitaḥ ciiqciiqa.
 hitaas-(q)ḥ=(m)it=(m)aḥ ciq-LR2L.a
 be.outside-LINK=PST=REAL.1SG speak-RP
 ‘I was speaking outside.’ (B, Bob Mundy)

- (169) ciiqciiqaḥ hitaas.
 ciq-LR2L.a-(q)ḥ=(m)it=(m)aḥ hitaas
 speak-RP-LINK=PST=REAL.1SG be.outside
 ‘I was speaking outside.’ (B, Bob Mundy)

Just as either predicate in a construction may take the linker, the linker may occur either on the first (170) or second (171) predicate in the utterance.

- (170) ʔaaʔaashintniš ciiqciiqa.
 ʔaaʔaas-(q)ḥ=int=niš ciq-LR2L.a
 be.outside-LINK=PST=STRG.1PL speak-RP
 ‘We were speaking outside.’ (N, Fidelia Haiyupis)

²There are some cases where altering the ordering affects grammaticality judgments. I believe this has to do with a preference for the predicate with the linker attached to come first and, between two predicates, for certain semantic classes to host the linker over others. I address these in §5.1.9.

- (171) *ciiqciqamitniš ʔaaʔaash.*
ciq-LR2L.a=mit=ni·š ʔaaʔaas-(q)h
 speak-RP=PST=STRG.1PL be.outside-LINK
 ‘We were speaking outside.’ (N, Fidelia Haiyupis)

Although there is flexibility as to which predicate takes the linker, clauses may not be headed by a single predicate with a linker. This can be seen for main clauses in (172, 173) below.

- (172) *qiiʔiʔs ʔupkaaʔh.*
qiiʔiʔ=s ʔupk-(y)a·-(q)h
 lie.in.bed.a.long.time=STRG.1SG awake-DR-LINK
 ‘I lay awake inside for a long time.’ (N, *yuuʔnaak* Simon Lucas)

- (173) **ʔupkaaʔhs qii.*
ʔupk-(y)a·-(q)h=s qii
 awake-DR-LINK=STRG.1SG long.time
 Intended: ‘I lay awake for a long time.’ (N, *yuuʔnaak* Simon Lucas)

(173) has undergone two changes relative to (172): (i) the words have been rearranged, and (ii) the ending *-ʔiʔ*, a predicative location (Davidson, *forthcoming*) has been taken off the adverb *qii*. The former change should not affect the grammaticality of the sentence, as demonstrated in (170, 171). But the latter change creates an utterance with “linked” predicate followed by the syntactically non-predicative adverb *qii* (173). In contrast, (172) contains two full predicates. Because the adverb *qii* cannot be a syntactic predicate, (173) only has one predicative word with a linker morpheme, and no further predicate for that linker to coordinate with.

Like main clauses, a dependent clause may not be headed by a single predicate with a linker morpheme, as shown in (174, 175).

(174) ʔuuʔaqstuʔaḥ ʔanik hiʔ ʔaḥkuu.

ʔuuʔaqstuʔ=(m)a·ḥ ʔani=k hiʔ ʔaḥkuu
be.happy.MO=REAL.1SG COMP=2SG be.at D1

'I'm happy you're here.' (B, Bob Mundy)

(175) *ʔuuʔaqstuʔaḥ ʔanik hiḥ ʔaḥkuu.

ʔuuʔaqstuʔ=(m)a·ḥ ʔani=k hiḥ-(q)ḥ ʔaḥkuu
be.happy.MO=REAL.1SG COMP=2SG be.at-LINK D1

Intended: 'I'm happy you're here.' (B, Bob Mundy)

Although the word *hiʔ* 'be at' frequently takes the linker in texts, it is ungrammatical in (175), where it is the sole predicate of the dependent clause. I was able to replicate a similar example with a Checleseht speaker from the other end of the dialect continuum (176, 177).

(176) ʔaacsiičḭintiis ʔin hiʔ čimsʔii maḥṭeekitk.

ʔaaca-i·čḭ=int=(y)iis ʔin hiʔ čims=ʔi· maḥṭii=ʔak=ʔi·tk
see.DR-IN=PST=WEAK.1SG COMP be.at bear=ART house=POSS=DEFN.2SG

'I saw there was a bear at your house.' (Q, Sophie Billy)

(177) *ʔaacsiičḭintiis ʔin hiḥ čimsʔii maḥṭeekitk.

ʔaaca-i·čḭ=int=(y)iis ʔin hiḥ-(q)ḥ čims=ʔi· maḥṭii=ʔak=ʔi·tk
see.DR-IN=PST=WEAK.1SG COMP be.at-LINK bear=ART house=POSS=DEFN.2SG

Intended: 'I saw there was a bear at your house.' (Q, Sophie Billy)

From these examples, I conclude that the linker requires two predicates to coordinate. This means that the syntactic head of a clause cannot be a predicate with linker morphology. The head must either be the linker itself, or the predicate without linker morphology.

5.1.4 Sharing second position suffixes and clitics

Nuuchahnulth has a series of clausal second-position enclitics, which include tense and subject-mood portmanteaus. In a linker construction, both predicates share the same subject, mood, and tense.

(178) hiłhʔum maḥʔiiʔakqs wiinapuł.

hił-(q)h=ʔum maḥʔi=ʔak=qs wiinapuł
be.at-LINK=CMFU.2SG house=POSS=DEFN.1SG stop.MO

‘Stop at my house.’ (N, Fidelia Haiyupis)

The command portmanteau =ʔum in (178) syntactically scopes³ over both predicates. My consultant did not accept this as possibly meaning that someone else was stopping. If these clitics belong to the clause as a whole, which there is good independent reason to believe (Rose 1981:35–36, Woo 2007:42–50), the linker coordinates predicates below the level of the clause.

In addition to the clausal second-positions, there are some suffixes which I claim appear in a predicative second position (Inman 2018). [[TODO: Regurgitate a summary of the “predicate position” argument in the clause chapter!]] These include modals and, importantly, the linker itself. The modals in this predicative second position seem to be shared across linked predicates, in a similar fashion to the clitics.

Context for (179): I am taking a friend home and we are leaving a gathering.

(179) wałšiłwitasniš ʔihaaqh.

wał-šił-LS-witas=niš ʔih-(y)a-qh
go.home-MO-GRAD-going.to=STRG.1PL drive-CV-LINK

‘We’re going to drive home.’ (C, tupaat Julia Lucas)

Both verbs in (179) share the semantics of the modal suffix -witas, because both the driving and the going home are intentional, not-yet-occurred events. I confirmed the sharing of the subject portmanteau

³Because of the utility of the concept of scoping in this discussion, I will use the word “scope” from here on to refer to a syntactic element that has an effect over another syntactic element. This should not be confused with scopal semantics.

=*ni's* by asking if it were possible to say (179) to mean that we were going to walk home but someone else was driving elsewhere. My consultant said no: (179) must mean that it is we who are going to go home and we who are doing it driving in a car.

(180) and (181) provide a situation where the obligatory subject sharing creates an odd interpretation. I was asking about different activities depending on the weather. The felicitous expression without the linker is in (180). My rephrase in (181) with the linker was met with an immediate laugh.

- (180) *ṇačaaḷahʔaaḷa miḷaaʔaḷquu.*
 ṇačaaḷ=(m)aʔh=ʔaaḷa miḷ-(y)aʔ=!aḷ=quu
 read=REAL.1PL=HABIT rain-CV=NOW=PSSB.3
 ‘I read whenever it rains.’ (B, Bob Mundy)

- (181) *#ṇačaaḷahʔaaḷa miḷaaqh.*
 ṇačaaḷ=(m)aʔh=ʔaaḷa miḷ-(y)aʔ-(q)h
 read=REAL.1PL=HABIT rain-CV-LINK
 # ‘I read and I am raining.’ (B, Bob Mundy)

Both predicates in a linker construction share the semantics of the second-position clitics, which importantly means they share a subject. They also share at least modal suffixes from what I term the second-position predicate position.

5.1.5 *Linkers on non-verbs*

The examples so far have focused on linkers attached to verbs. For English speakers, verbal coordination is perhaps the easiest example of syntactic predicates sharing inflectional properties. However, as detailed in §5.1.2, it is possible for the linker to attach to a wide variety of non-verbs. The properties of the linker are identical on non-verbs, but it is worthwhile to look at how this works.

Perhaps the most common type of non-verbal predicate that receives the linker is quantificational adjectives (henceforth, quantifiers). The presence or absence of the linker on a quantifier significantly

changes the possible interpretations for the sentence. With a bare (non-linked) quantifier, the quantifier may be interpreted as a syntactic object (182) and may not come before the verb (183). When a linker is attached, the quantifier must be interpreted as the subject and may either come before (184) or after the verb (185).

Context for (182–185): My family and I are looking for a Christmas present for my sister.

(182) ʔuuwaʔaʔ ʔuuš.

ʔu-L.waʔ=!aʔ ʔuuš

x-find=NOW some

‘He/she found something.’ (*? Someone found it) (C, *tupaat* Julia Lucas)

(183) *ʔuuš ʔuuwaʔaʔ.

ʔuuš ʔu-L.waʔ=!aʔ

some x-find=NOW

Intended: ‘He/she found something.’ (C, *tupaat* Julia Lucas)

(184) ʔuuwaʔaʔ ʔuušqḥ.

ʔu-L.waʔ=!aʔ ʔuuš-qḥ

x-find=NOW some-LINK

‘Someone found it.’ (*He/she found something) (C, *tupaat* Julia Lucas)

(185) ʔuušqḥʔaʔ ʔuuwaʔ.

ʔuuš-qḥ=!aʔ ʔu-L.waʔ

some-LINK=NOW x-find

‘Someone found it.’ (*He/she found something) (C, *tupaat* Julia Lucas)

In (184, 185), the two predicates being linked are *some* and *find*. Because quantifiers are possible predicates in Nuuchahnulth, the same analysis applied to two linked verbs can apply here: These are two predicates that share a subject. That is, there is a (null) third-person subject that is shared between

the predicates *some* and *find*: “There exists an x such that $some(x)$ and $find(x,y)$.” This subject sharing makes the objective reading impossible in (184, 185).

Julia rejected an interpretation of (182) where non-linked *ʔuuš* ‘some’ was interpreted as the subject. However, in another context she produced (186), where *ʔuuš* ‘some’ is in fact given a subjective interpretation.

(186) ʔuušʔiišʔaaʔ wićik, ʔuuš ʕaćik, ʔuuš ʔuṁaaqʕ ʔuuʔip.

ʔuuš=ʔi·š=ʔaaʔ wićik, ʔuuš ʕaćik, ʔuuš ʔuṁaaqʕ ʔu-iʔip

some=STRG.3=HABIT not.talented, some talented, some able.to x-get

‘Some are not talented, some are talented, some are able to get (the challenge).’ (C, *tupaat* Julia Lucas)

In (186), the first two verbs are intransitive, so there is no other syntactic interpretation for *ʔuuš* ‘some’ other than the subjective one. The final verb is transitive, but the parallelism with the first two clauses primes the listener to interpret *ʔuuš* as subjective. The fact that Julia did not add a linker in (186) shows that a subjective interpretation is possible for non-linked quantifiers.

This observation about quantifiers holds true for other adjectives and also nouns, as seen in (187–189). The initial sentence puts two clauses together with a complementizer (187), but can be rephrased without a complementizer by using the linker (188, 189).

Context for (187–189): I arrived on the beach in a canoe. I left my canoe and went into town. While I’m inside, my canoe is carried out on the tide and capsizes. One person left behind on the beach sees it. (187) was suggested by my consultant, and we worked to rephrase it as (188) and (189). My consultant was adamant that (187) and (188) meant exactly the same thing. If this is true, then the linker is not adding any deep semantic content.⁴

⁴My analysis ends up putting in a relation AND. While this may not be totally meaningless, it is virtually meaningless.

- (187) *ćawaakitwaʔiš ńaacsá niiʔatu ćapac.*
ćawaak=it=waʔiš ńaacsá niiʔatu ćapac

 one-LINK=PST=HRSY.3 see.DR sink canoe
 'I hear that one (person) saw the canoe sink.' (C, *tupaat* Julia Lucas)
- (189) *quuʔasqḥitwaʔiš ńaacsá niiʔatu ćapacʔi.*
quuʔas-(q)ḥ=it=waʔiš ńaacsá niiʔatu ćapac=ʔi
 person-LINK=PST=HRSY.3 see.CV sink canoe=ART
 'I hear that a person saw the canoe sink.' (C, *tupaat* Julia Lucas)

Using the same setup as (187–189), I elicited sentences from another speaker. This consultant initially proposed the sentence in (190). I proposed (191) by removing the linker, which he rejected, and then (192), which he accepted.

- (190) *ńaacsiičĩłweʔin ćawaakḥ niiʔatu ćapac.*
ńaacsá-i-čĩł=weʔin ćawaak-(q)ḥ niiʔatu ćapac
 see.CV-IN=HRSY.3 one-LINK sink canoe
 'I hear that one (person) saw the canoe sink.' (B, Bob Mundy)
- (191) **ńaacsiičĩłweʔin ćawaak niiʔatu ćapac.*
ńaacsá-i-čĩł=weʔin ćawaak niiʔatu ćapac
 see.CV-IN=HRSY.3 one sink canoe
 Intended: 'I hear that one saw the canoe sink.' (B, Bob Mundy)

- (192) *ñaacsiičĩłweʔin cawaakḥ quuʔas niiʔatu čapac.*
ñaacsa.CV-i·čĩł=weʔin cawaak-(q)ḥ quuʔas niiʔatu čapac
 see-IN=HRSY.3 one-LINK person sink canoe
 ‘I hear that one person saw the canoe sink.’ (B, Bob Mundy)

Bob’s response to removing the linker in (191) was to say, “It’s not complete. One what? What did one see?” Following the basic structure of the Nuuchahnulth clause (§3), the participants of the syntactic predicate *ñaacsiičĩł* ‘see’ should be *cawaak* ‘one’ and *niiʔatu čapac* ‘sink canoe’. But *cawaak*, as an adjective, cannot be a full NP participant without an article (Jacobsen 1979). So it is stranded and the utterance (191) is nonsensical. The presence of the linker in my consultant’s initial proposed sentence (190) forces ‘one’ to be coreferenced with the subject of ‘see’, as already shown for the quantifiers in (182–185). The other participant of the seeing act (what is seen) is the dependent clause ‘sink canoe’.

Example (192) shows that the linked clause not headed by a verb can include more than one word. Here *cawaak* ‘one’ is a predicate with a subject *quuʔas* ‘person’. This dependent clause also interrupts the matrix predicate *ñaacsiičĩł* ‘see’ and its clausal object *niiʔatu čapac* ‘the canoe sink.’ In §5.1.3 I argued that linker constructions were either headed by the predicate lacking linker morphology or the linker itself. The syntax of (192), where a predicate, linker, and its participant can all interrupt another predicate with and its participant is evidence in favor of an analysis where the non-linked predicate is the sentential head, and the linker forms a dependent clause. A rough bracketing of (192) based on this preliminary analysis is given in (193).

- (193) [*ñaacsa.CV-i·čĩł=weʔin [cawaak-(q)ḥ quuʔas]*_{linked_clause} [*niiʔatu čapac*]_{participant_of_see}]
 see-IN=HRSY.3 one-LINK person sink canoe

[[TODO: track down subscript rendering problem above]]

5.1.6 Ordering in linker constructions

I have already demonstrated that the non-linked predicate may be separated from its complement by an intervening linked predicate (190, 192, 193). The reverse ordering is also possible. The linked predicate

may be separated from its direct object by the non-linked predicate. In (194) the verb *hit* ‘be at’ and its object ‘my house’ are contiguous, but in (195) they are separated by the non-linked predicate *mamuuk* ‘work’.

(194) *hiłhitin mahtiiʔakqas mamuuk.*

hił-(q)h=(m)it=(m)in mahtii=ʔak=qas mamuuk
 be.at-LINK=PST=REAL.1PL house=POSS=DEFN.1SG work

‘We worked at my house.’ (B, Bob Mundy)

(195) *hiłhitin mamuuk mahtiiʔakqas.*

hił-(q)h=(m)it=(m)in mamuuk mahtii=ʔak=qas
 be.at-LINK=PST=REAL.1PL work house=POSS=DEFN.1SG

‘We worked at my house.’ (B, Bob Mundy)

Not only is (195) grammatical but this is often the structure speakers prefer. For one of my consultants, Northern dialect speaker Fidelia Haiyupis, this kind of object separation was acceptable when the linked predicate was separated from its object (196) but not when the non-linked predicate was separated from its object (197, 198). I can only note that this may be a feature of Northern dialects, but it is unclear from the small amount of data that I have.

(196) *hiłhsiiš ʔuukʷiił čupčupšuml mahtiiʔakʔik.*

hił-(q)h=siš ʔu-L.(č)iił čupčupšuml mahtii=ʔak=ʔik
 be.at-LINK=STRG.1SG X-make sweater house=POSS=DEFN.2SG

‘I am making a sweater at your house.’ (N, Fidelia Haiyupis)

(197) *ʔuuctiiłs Queens Cove λiħaaqħ.*

ʔuuctiił=s Queens Cove λiħ-(y)a·-(q)h
 go.toward.DR=STRG.1SG Queens Cove drive-CV-LINK

‘I am driving to Queens Cove.’ (N, Fidelia Haiyupis)

(198) *ʔuuctiiḥs ʔiḥaaqḥ Queens Cove.

go.toward.DR=STRG.1SG drive-CV-LINK Queens Cove

Intended: 'I am driving to Queens Cove.' (N, Fidelia Haiyupis)

For most speakers, however, both types of “interruption” are possible.

5.1.7 *The linker and the predicate complex*

Like many bound morphemes in Nuuchahnulth, the linker appears to attach to the first word in some clause. This has already been seen in (165), repeated as (199) below.

(199) ʔuuqʷaaqḥs ʔasqii ʔaanaḥi wik hinʔaʔšiḥ.

ʔuuqʷaa-qḥ=s ʔasqii ʔaanaḥi wik hinʔaʔ-šiḥ

also-LINK=STRG.1SG bald only NEG aware-MO

'I'm also bald but I don't know it.' (C, *tupaat* Julia Lucas)

The two predicates being tied together in (199) sentence are 'also bald' and 'only not know (it)'. The linker appears on the preposed adverb *ʔuuqʷaa* of the first predicate. Examples like this are difficult to gather directly as they require special context and it is possible to express the same meaning without the linker, but a few examples occur in the Nootka Texts. In (200) the linker also attaches to the preceding adverb of its linked predicate 'still at war', and links that to the still later predicate 'grab their guns.'

(200) ʔeʔimqḥʔaʔquuweʔin hitaḥtačiḥ sukʷiʔaʔ puuʔakʔiʔaʔ.

ʔeʔim-(q)ḥ=!aʔ=quu=weʔin hitaḥta-čiḥ su-kʷiḥ=!aʔ puu=ʔak=ʔiʔ=ʔaʔ

first-LINK=NOW=PSSB.3=HRYS.3 go.out.to.sea-MO hold-MO=NOW gun=POSS=ART=PL

'As soon as they left the land, they would take their guns.' (B, Sapir & Swadesh 1955:395)

In (201), the linker again attaches to an adverb *ʔiiqḥii* 'still', and links the entire predicate 'still doing war' to the earlier predicate *qʷis* 'do thus.'

- (201) qiiḥsḥaakckin ʔaḥ qʷiyiič [[qʷis] [ʔiiqḥiiqḥ hitačink maatmaasʔi]] qahsaapʔaḥquuweʔin čamuʔaḥʔaḥquu

 ‘For a little longer after this happened, while the tribes were still at war, the Ucluelets would kill
 Huu-ay-ahts when they saw their canoes.’ (B, Sapir & Swadesh 1955:392)

TODO: NOTE: What is ʔiiqḥiiqḥ linking? It isn’t qʷis, it’s a sentence shoved in a longer sentence. Go look at preceding sentences. Is there a shorter example?

These examples, as well the case of modal suffix scoping have led me to believe there is a phrasal unit between the clause (where the second position clitics scope) and the main predicate. I have dubbed this the “predicate phrase.” This phrase consists maximally of the predicate word and preceding adverbs. The predicate linker will attach to the first word in the predicate phrase, whether that is the predicate word itself or a preceding adverb. [[TODO: Move the main arguments up to the clause section]]

5.1.8 Dangling linkers

There is one case I know of where the linker does not appear to be linking its predicate to anything. I believe that the interpretation shows that there is an elided phrase (202).

- (202) ʔuʔaahukḥʔiʔaḥ.
 ʔu-!aahuk-(q)ḥ=!i·=ʔaḥ
 x-look.after-LINK=CMMD.2SG=HABIT
 ‘Take care!’ (N, Fidelia Haiyupis)

The meaning of (202) is “Farewell, look after yourself in whatever you’re doing.” But “whatever you’re doing” is dropped from the sentence. I think that the linker is a leftover from the elided phrase.

Adam: It’s a typical farewell in Barkley dialects but in the north it is not typical.

5.1.9 Semantic and ordering preferences

Despite the relative flexibility of which predicate in a construction gets the linker (§5.1.3), there are some cases where speakers strongly prefer the linker to go on one or the other predicate.

In a sentence expressing action at a location, speakers I worked with preferred to put the linker on the location word, and not on the action word. Sometimes speakers rejected other orderings, as in (203–205).

speak.publicly-LINK=WEAK.1SG be.at-LINK outside
Intended: 'I'm speaking outside.' (Q, Sophie Billy)

[[TODO: ? $\dot{\lambda}$ aaʔaasḥiis ciiqmaʔap]]

I was unable to find a case where Sophie would use a linker in such cases on any word other than the location word, and in the (small) corpus of speech I have from her, there are no instances of her doing so. Sophie uses the linker construction much less than all other language consultants I worked with, and rejected many constructions that other speakers used. She is the youngest known fluent speaker, and her speech represents a very innovative Checkleseht dialect. In the data I collected, she most readily attached the linker to quantificational adjectives and location words, and rarely used it elsewhere.

With other consultants who used the linker more widely, they would sometimes reject reorderings or sample sentences that occurred within a set. The following series is from Bob Mundy, a Ucluelet elder, who preferred linked predicates to be the first predicate in the sentence. (206) and (207) are repeated from (169) and (168) respectively.

[[TODO?: Repeat with 4th option in mix, *ciiqciiqamitaḥ hitaash*]]

While Bob was adamant about his ungrammatical judgment, I think the context of rephrasing is important, as this transforms the grammaticality question into something like a ranked choice task. I do not think (208) is truly ungrammatical, as Bob would still generate this kind of ordering in fluent speech. Despite his judgment about here, in another context Bob unprompted produced sentences with the second-predicate linked, as in (190) and (??).

Both the rephrasing data from Bob and the restricted use of the linker by Sophie suggests some general preferences: all else being equal, a location word should not be the one linked, and the first word

should be the one with the linker. [[TODO: Get some numbers over the example sentences collected so far]]

5.1.10 *Data Summary*

The data presented so far leads to the following conclusions:

1. The linker may attach to any content word of Nuuchahnulth. This includes nouns, adjectives (including quantifiers), verbs, and adverbs, and excludes complementizers.⁵ (§5.1.2)
2. A clause may not consist of only a linked predicate. (§5.1.3)
3. Both predicates in a linker construction shares the second-position inflectional information, including subject. (§5.1.4)
4. The linker does not add semantic content to a predicate. (§5.1.4)
5. The properties of the linker do not alter depending on whether it attaches to a verb or other part of speech. (§5.1.5)
6. It is possible for either predicate in a linker construction to be separated from their complement by the other predicate. (§5.1.6)
7. The linker attaches to the first word in its predicate complex, even if that first word is an adverb that precedes the predicate. (§5.1.7)
8. In certain pragmatically restricted environments, the linker can be used without attaching to a matrix clause. A plausible interpretation in this context is of an elided predicate. (§5.1.8)
9. There seems to be a preference for linked predicates to occur first and on location words (§5.1.9).

⁵There is more to say about a possible class of adpositions. This is addressed in §5.2.3.

5.2 Application of the linker to categoricity questions

There are some words in Nuuchahnulth whose part of speech properties are not entirely clear. Woo (2007) examines Nuuchahnulth's large (but closed) set of adpositive-like words, and ends up categorizing them as special types of verbs (some of them little-*v*, from a Minimalist perspective). There are other words whose status is somewhat unclear, such as *ʔuunuuʔ*/*ʔunwiiʔ* 'because of an event', *ʔuusaahi* 'because of a thing', and *ʔuyi* 'at a time'. Some of these words accept the linker and others do not. Recall that the linker typically occurs freely on content words such as verbs (5.1.2), so if these words are verbs, or at least normal verbs, the linker should be able to attach.

Briefly, I show here that *ʔuunuuʔ*/*ʔunwiiʔ* 'because of an event' do accept the linker, while *ʔuusaahi* 'because of a thing' may not (5.2.1). Similarly, *ʔuyi* 'at the time' only accepts the linker marginally (5.2.2). Most of the adpositive-like verbs can also accept the linker (5.2.3), but not the special non-subject marking⁶ adpositives *ʔuukʷit* and *ʔuhta*. This aligns with Woo's findings, where these words are functional and non-predicative.

The marginal cases of *ʔuusaahi* and *ʔuyi* suggest words moving from a simple verb to another category, either a restricted verb type or an incipient category of prepositions. On the other hand, evidence from the linker suggests that *ʔuukʷit* and *ʔuhta* are members of a special syntactic category, either a very small class of prepositions or little-*v*, depending on one's syntactic framework.

5.2.1 'Because' words

There are three words in Nuuchahnulth that roughly translate to English 'because': *ʔuusaahi* (all dialects), *ʔuunuuʔ*⁷ (Barkley and Central, recognized but rare in Northern and Kyuquot-Checlesht) and *ʔunwiiʔ* (Northern and Kyuquot-Checlesht only).

To lay some terminological groundwork, I will be using the technical terms *protasis* and *apodosis*. The

⁶The marking properties of these words and are somewhat more complex than this simple story. [[TODO: Put this in the clause section – It's just non-ARG1, cite Woo.]]

⁷Elder *tupaat* Julia Lucas, who is an Ahousaht speaker, consistently pronounces this word as *ʔunʔuuʔ*. I do not know whether this is a feature of her particular idiolect or a sub-Ahousaht dialect feature of which she is the only known (to me) speaker. I transcribe the word as she pronounces it.

protasis is the part of the sentence describing the condition, and the *apodosis* is the part of the sentence describing the consequence or result. I will call the words relating these propositions *because* *because* *because*.

ʔuunuuł and *ʔunwiił* appear to be dialectal variants with the same meaning and use patterns. The most straightforward way to use the words is as the first word, or main predicate of the sentence (209, 210), where they take the second position clitic complex, including the subject portmanteau. It is hard to conceive of the relation BECAUSE having a subject, and indeed the subject agreement marks the subject of the apodosis. Argument-dropping is common for Nuuchahnulth verbs, and these constructions can often drop the apodosis and realize it in a later clause (209), if at all.

(209) ʔuunuułitaḥ wik λuł weʔič. ʔihakita naʔaqak.

ʔuunuuł=(m)it=(m)aʔḥ wik λuł weʔič. ʔihak=(m)it=maʔ naʔaqak

because=PST=REAL.1SG NEG good sleep. cry=PST=REAL.3 baby

 because-LINK=PST=DUBV=PL medicine-have COMP win
 Intended: ‘They won because they had medicine.’⁸(C, *tupaat* Julia Lucas)

As demonstrated in (212, 213), the becausative can have a linker attached, in which case the linker must be linking the becausative to the following apodosis, since the protasis is explicitly subordinated by the complementizer. The complementizer is optional in this linker construction, and the order of becausative and apodosis is flexible (214).

- (214) hiniʔiʔs ʔunwiiʔh miʔšiʔ.
 hiniʔiʔs=ʔ ʔunwiiʔ-(q)h miʔ-šiʔ
 inside.MO=REAL.ISG because-LINK rain-MO
 ‘I am inside because it started raining.’ (N, Fidelia Haiyupis)

One of my consultants, Bob Mundy (Ucluelet), translated the linker attachment in this way: *ʔuunuuʔ* is ‘because’ and *ʔuunuuʔh* is ‘that’s why.’ This is a fairly succinct way of translating the presence of the linker.

So far, the evidence suggests that these becausatives have at least one argument, the protasis, which can optionally be introduced with a complementizer. The apodosis is more complicated since it is the argument that the linker morpheme “links” the becausative to (214). If the linker is behaving here as it has in other constructions, that would mean that the apodosis is not an argument of the becausative in

⁸The actual meaning of (213), ‘they had medicine because they won’ would be the opposite of what makes sense in the story. “It’s backwards,” in my consultant’s words.

those constructions. So is the apodosis an argument in the because constructions without the linker in (209–211)?

I believe the answer is no: The apodosis is never an argument of the becausative. (209–211) have the same argument ordering as in (214), but without a linker attached. The protasis is also explicitly subordinated with a subordinate subject-mood portmanteau (the definite and the weak moods, respectively). The apodosis is the main predicate of the sentence and takes the main clause's subject-mood portmanteau. If the becausative is a verb, the structure in (209–211) is very like the SVCs of adpositive-like verbs (§4.2).

Context for (215, 216): Two teams are playing tug of war. Our team is strongest and we won.

(215) hiteʔitapin ʔuunuuʔ naʂukqin.

hiteʔitap=(m)in ʔuunuuʔ naʂuk=qin

win=REAL.1PL because strong=DEFN.1PL

'We won because we are strong.' (B, Marjorie Touchie)

(216) tuunuumitniʂ ʔunwiiʔ ʔaaʔakin.

tuunuu=(m)it=niʂ ʔunwiiʔ ʔaaʔak=(y)in

win=PST=STRG.1PL because strong=WEAK.1PL

'We won because we are strong.' (N, Fidelia Haiyupis)

Examples like (215) and (216) are in some ways the rarest form of the because construction. My consultant Marjorie Touchie (Ucluelet) freely and frequently produced constructions like this, but Fidelia Haiyupis (Ehatesaht) and Julia Lucas (Ahousaht) rejected examples like this, insisting that these cases needed to contain a linker. However, both Fidelia and Julia produced such a sentence in fluent speech. If I had to make a guess about why these sentences sounded strange out of the blue, it would be that the becausative-first construction is the older and more conservative pattern, while the apodosis-first construction is newer, possibly under the influence of the English word order. However, this is speculation.

Finally, ʔuunuuʔ/ʔunwiiʔ must take a protasis that is verbal, not nominal (217, which is from the same

context as 209) or adjectival (218). This is somewhat unusual, given the language's flexibility around predication (§3).

Move because of the baby 214 up here

(217) *wikitaḥ λuḥ weʔič ʔuunuuḥ naʔaqakʔisʔi.

win=HRSY.3 race child=DIM=ART because strong

Intended: 'The kid won the race because he is strong.' (B, Bob Mundy)

The evidence suggests something like the following for *ʔuunuuḥ* and *ʔunwiiḥ*. These words are verbs that take a single clausal complement, a protasis, which must be verbal and may be optionally introduced by a complementizer. The way the BECAUSE relation is syntactically related to its apodosis is either through a SVC, which behaves much like the adpositive-like SVCs, or via a linker construction which links the apodosis and becausative.

Where *ʔuunuuḥ* and *ʔunwiiḥ* behave as verbs with a verbal complement representing the protasis, *ʔuusaahʔi* requires its nominal complement protasis. Examples (219, 220) below are a rephrasing of (209), demonstrating that, opposite from *ʔuunuuḥ/ʔunwiiḥ*, *ʔuusaahʔi* must take a noun phrase protasis and not a verbal clause.

because.of=STRG.1SG NEG good sleep COMP bark-RP dog

'I didn't sleep well because of the dog.' (C, *tupaat* Julia Lucas)

ʔuusaahi is able to take the linker, although like the use of the complementizer, this changes the syntactic category of its complement, from a noun or participant to a clause.

(225) ʔuusuqtumtʔiʃ ʔuusaahi qh wikaʔuk^wint.

ʔuusuqta=umt=ʔiʃ ʔuusaahi-(q)h wik-!aʔuk=int

hurt=PST=STRG.3 because-LINK NEG-look.after=PST

‘He got hurt because he wasn’t paying attention.’ (N, Fidelia Haiyupis)

Like *ʔuunuuiʃ/ʔunwiiʃ*, *ʔuusaahi* appears to be a verb taking a single argument, a protasis. This is associated with the apodosis of the BECAUSE relation via either a serial verb construction with the clausal apodosis, or with a linker. Unlike *ʔuunuuiʃ/ʔunwiiʃ*, *ʔuusaahi* takes a nominal protasis, but this can be changed into a verbal protasis with either the introduction of the complementizer or by attaching the linker to *ʔuusaahi*.

5.2.2 *ʔuyi*

Of the possibly-verbal, possibly-adpositional words in Nuuchahnulth, *ʔuyi* and *ʔuuk^wit* are perhaps the most ambiguous cases (Adam Werle, *p.c.*). The meaning of *ʔuyi* is ‘at (a time)’ and it typically cooccurs with another predicative word in a sentence. In this case, the clausal clitics scope over both predicates (226–230). The temporal complement of *ʔuyi* can be a nominal either occurring after (226) or before (227) *ʔuyi* itself, it can be expressed in a clause with a dependent mood such as the possible mood (228) or the definite mood (229), or it can be dropped from the clause entirely (230).

ʔuyi=!um kith-ʔiʔ si-L.(ʔ)iʔ
at.a.time=CMFU.2SG ring-MO 1SG-do.to

‘Call me then.’ (C, *tupaat* Julia Lucas)

ʔuyi has a tendency to double in fluent speech: as the first predicate of a two-utterance, then later following its object (231, 232). This could be described grammatically as the first *ʔuyi* occurring with a dropped argument and the second with its object. Note that the sentence in (232) is grammatical without the doubling (233).

- (231) ʔuyimtinʔaʔaʔa waʔaak May ʔuyiʔeʔ.

ʔuyi=imt=(m)in=ʔaʔaʔa waʔaak May ʔuyi=ʔaʔ
at.a.time=PST=REAL.1PL=HABIT go.to May at.a.time=NOW

‘We would go (there) in May.’ (B, Bob Mundy)

 'I walk in the morning.' (C, *tupaat* Julia Lucas)

(233) ʔuyisʔaʔ yaacuk kuʔaʔ.

ʔuyi=s=ʔaʔ yaacuk kuʔaʔ
 at.a.time=STRG.1SG=HABIT walk.DR morning
 'I walk in the morning.' (C, *tupaat* Julia Lucas)

The features of *ʔuyi* so far are in line with other verbs. The clitic-sharing across predicates and the structure of (233) in particular is identical to other serial verb constructions (see TODO serial verb section). However, the doubling in (231, 232) is unique. One point of differentiation is that *ʔuyi* only marginally accepts the linker. After attempting to elicit and construct examples of linked *ʔuyiqh*, Barkley speakers Bob Mundy and Marjorie Touchie said that *ʔuyiqh* was not a word. They rejected a construction that added a linker to an expression for 'tomorrow' (234), as did Central speaker Julia Lucas when I presented her with the same construction (235). Marjorie Touchie immediately corrected (234) by telling me that the way to say this would be with *ʔuyi ʔamii*.

(234) *ʔuyiqhʔaʔaʔ ʔamii mamuuk hiʔ makuwiʔ.

ʔuyi-(q)h=ʔaʔ=(m)aʔh ʔamii mamuuk hiʔ makuwiʔ
 at.a.time-LINK=NOW=REAL.1SG one.day.away work at.a.location store
 Intended: 'I will go to work at the store tomorrow.' (B, Bob Mundy & Marjorie Touchie)

PL-doctor-take.action.on-for.the.purpose.of=POSS=ART

'As they make the circuit, dragging them along by the hair, they sing his doctoring songs.' (Sapir & Swadesh 1939:105)

The marginality of linkers on *ʔuyi* – and its capacity for grammatical doubling – suggests that there is something special about this word, although it behaves in most other ways like a verb entering into a serial verb construction. Like *ʔuusaahi* (§5.2.1), *ʔuyi* may be a change-in-progress, from a verb to something preposition-like.

5.2.3 *Adpositive-like words*

In her dissertation, Woo (2007) examines the syntax of what she terms “prepositional predicates” and, ultimately, agrees with previous researchers that these words are verbs. The words she considers

are: (1) *ʔuuḥwāt* ‘using’, (2) *ʔuuʔink* ‘using’, (3) *ʔuuchin* benefactive, (4) *ʔuʔatup* benefactive/recipient, (5) *ʔuukčamatčiqh* ‘do together with someone’, (6) *ʔukʷink* ‘go with’, (7) *ʔuukʷit* ‘do to’, (8) *ʔuhta* ‘do to’, and (9) *ʔuh* subject marker.

Woo separates out the last three of the list from the rest. The first six of these prepositional predicates introduce an extra argument into the clause, and using the Minimal Framework, Woo categorizes them as full verbs (V) which, when working in concert with a main verb, coordinate at the level of *v*P. This is supported in part by the first set of words can occur as the sole predicate of a sentence.

However, the latter three words (*ʔuukʷit*, *ʔuhta*, and *ʔuh*) optionally mark arguments already inherent in the main verb. They require a main predicate to form a grammatical sentence (or may only be used alone in special circumstances, like question-answering). These Woo categorizes as flavors of *v*.

Although I approach my analysis from within a different framework, I agree with Woo’s broad categorization. I checked speaker’s intuitions about attaching the linker *-(q)h* to these adpositive-like words and the judgments I received support Woo’s bifurcation into two categories, and importantly that the first category are in fact verbs. Not all speakers recognize or use all of these adpositive-like words, so I was only able to test a subset. There is also a morphophonological problem testing *ʔuh* (which would be a **ʔuhh* with the linker). However, I have collected data on (1) *ʔuuḥwāt*, (3) *ʔuuchin*, (4) *ʔuʔatup*, (not in Woo’s list) *ʔuupaat*, (7) *ʔuukʷit*, and (8) *ʔuhta*. In short, the words Woo’s calls verbs mostly accept the linker, while all of her “little-*v*” words do not.

5.2.3.0.1 *ʔuuḥwāt* The adpositive verb *ʔuuḥwāt* ‘using’ can accept the linker in a sentence without any change of meaning.

(238) *wikcukʷapʔic* *ʔisʔiisa* *ʔuuḥwāt* *ʔiiscuuyak*.

wikcuk=!ap=ʔic *ʔis*-LR2L.a *ʔuuḥwāt* *ʔiiscuuyak*

- (239) *wikcuk^wap?ic* *λiisλiisa* *ʔuuḥwafḥ* *λiiscuuṽak*.
wikcuk=!ap=?ic *λis*-LR2L.a *ʔuuḥwał-(q)ḥ* *λiiscuuṽak*
 easy=CAUS=STRG.2SG write-RP using-LINK computer
 ‘It’s easy for you to write using a computer.’ (N, Fidelia Haiyupis)

5.2.3.0.2 *ʔuchin* The adpositive verb *ʔuchin* ‘for, on the behalf of’ can also accept the linker, although my consultant was less sure about it. She said that I could “get away with” (241) but thought it was unnecessary.

- (240) *ʔuchins* *mamuuk* *ʔuušḥýumsukqs*.

 BENEF-LINK=NOW=STRG.1SG work some-related.or.friend-NMLZ=POSS=DEFN.1SG
 ‘I’m working for my friend.’ (N, Fidelia Haiyupis)

5.2.3.0.3 *ʔuuʔatup* There is speaker disagreement on whether the adpositive verb *ʔuuʔatup* ‘on the behalf of, for the benefit of’ freely accepts the linker. My consultant *tupaat* Julia Lucas, a Central speaker, accepted it (242, 243) but my Barkley Sound consultants Bob Mundy and Marjorie Touchie did not (244, 245). This may be another case of a change in progress, where for my Barkley consultants, *ʔuʔatup* is coming to more closely resemble *ʔuuk^{wil}* grammatically (§5.2.3.0.5), something approaching a true adposition.

- (242) ʔakulis suwa ɥiyaɥi ʕapac ʔuuʔatup ɥaak^waaʔukʔitk.

 Intended: ‘I am dancing for the children.’ (B, Bob Mundy, Marjorie Touchie)

5.2.3.0.4 ʔuupaal Though this does not appear in Woo (2007), it is another adpositive-like verb that appears to have the same meaning as ʔuk^wink ‘with’. My consultants familiar with the word used it both with and without the linker.

- (246) ciiqmaɭapiwiʔasniʂ ʔuupaal ʔuk^wiiqsakqs.

‘Only Jane can call Alexandra younger.’ (C, *tupaat* Julia Lucas)

(253) **ʔuhta*aqh Jane *ʔuʔukʷil* Alexandra *ʔukʷiiqsu*.

ʔuhta-(q)h Jane *ʔuʔukʷil* Alexandra *ʔukʷiiqsu*

DO.TO-LINK Jane call Alexandra younger.sibling

Intended: ‘Only Jane can call Alexandra younger.’ (C, *tupaat* Julia Lucas)

5.2.4 Summary of the linker and class-ambiguous words

I believe that this data about the attachment of the predicate linker can help shed light on the categoricity of these words. *ʔuunuul* and *ʔunwiił* ‘because’ behave like verbs, and I believe they should be treated as such. *ʔuyi* appears verbal but more marginally so, and is possibly in the process of transitioning to a preposition. The adpositive-like words that can accept the linker seem to be clearly verbal, which agrees with Woo (2007)’s categorization. However the argument-marking words *ʔuukʷil* and *ʔuhta* behave differently, as befitting non-predicative words belonging to a different category.

Appendix A

ORTHOGRAPHY

Nuuchahnulth orthography is phonemically transparent. The writing system is fairly recent and is within the Americanist phonetic alphabet (APA) tradition, and bears a resemblance to that loose set of standards.

Nuuchahnulth has five vowel qualities, /a, e, i, o, u/ with a short/long distinction. Mid-vowels typically only occur long, although the Barkley and Central dialects have umlaut rules that derives short /e/ from /a/.¹ The consonant inventory is quite large and shown in Table A.1.

Table A.1: Nuuchahnulth consonants

plain										
plosives	p	t	ḷ	c	č	k	k ^w	q	q ^w	
glottalized										
plosives	p̰	t̰	ḷ̰	c̰	č̰	k̰	k̰ ^w		ʔ	ʔ̰
fricatives			ɬ	s	š	x	x ^w	ɣ	ɣ ^w	h
resonants	m	n			y	w				
glottalized										
resonants	m̰	n̰			y̰	w̰				

I list below the cases where the Nuuchahnulth symbols have a value other than their expected IPA interpretation:

- ɬ is the voiceless lateral fricative, ɬ
- ḷ is the voiceless lateral affricate, tɬ̰

¹The Barkley Sound rule is regressive, /aʔi/ → /eʔi/, and it applies consistently across the whole language. The Central rule is progressive, /iʔa/ → /iʔe/, and applies more irregularly, although it appears to occur most in frequent morpheme combinations.

- $\dot{\lambda}$ is the corresponding ejective, $\widehat{t\lambda'}$
- c is the voiceless alveolar sibilant affricate, \widehat{ts}
- \dot{c} is the corresponding ejective, $\widehat{ts'}$
- \check{s} is the voiceless postalveolar sibilant ʃ
- \check{c} is the voiceless postalveolar sibilant affricate $\widehat{tʃ}$
- $\dot{\check{c}}$ is the corresponding ejective, $\widehat{tʃ'}$
- \dot{x} is the voiceless uvular fricative, χ
- \dot{x}^w is the corresponding labialized fricative, χ^w
- \dot{h} is the voiceless pharyngeal fricative, ħ
- y is the voiced palatal glide, j
- $\dot{m}, \dot{n}, \dot{y}, \dot{w}$ are preglottalized: $\text{ʔ}m, \text{ʔ}n, \text{ʔ}y, \text{ʔ}w$
- ʕ is the so-called pharyngeal stop, which has been claimed to be a pre-glottalized pharyngeal $[\text{ʔʕ}]$ (Shank & Wilson 2000), or in the most complete study, an epiglottal stop with a pharyngeal off-glide $[\text{ʔ}^{\text{ʕ}}]$ (Carlson et al. 2001; Esling et al. 2005). To my ears it has multiple realizations, and it is difficult for me to distinguish from ʔ before $/a/$. It patterns in the phonology with the ejective series,² thus its placement in the chart.

²In places where the grammar would generate \dot{q} or \dot{q}^w , ʕ is always found instead. ʕ also occurs where cognate Makah words have either \dot{q} or \dot{q}^w .

Appendix B

GLOSSING CONVENTIONS

Many of the glossing conventions I use are non-standard and adapted particularly to the challenges of Nuuchahnulth. I will first address some of the special notations in the segmentation line, and then give the grams I use. There may be some grams not present here, but I have attempted to give all non-Leipzig standard glosses Comrie et al. (2008) here. The glossing conventions here were developed jointly by myself and Adam Werle, and represent only a part of our overall glossing schema. This section is only meant to give enough of a background to make the IGT in this dissertation intelligible and interpretable to linguists.

B.1 Segmentation symbols

There are four parts of Nuuchahnulth phonology that require special symbols in the morpheme segmentation: two types of consonant mutations, variable-length vowels, and segments that only appear after a vowel or nasal.

Consonant mutation is triggered by certain affixes, following patterns called “hardening” and “softening” (Werle 2010). A “hardening” suffix causes the preceding segment to become glottalized, resulting in an ejective in the case of stops and affricates, and otherwise inserts a glottal stop. The hardening pattern for fricatives differs between hardening suffixes and hardening clitics. Suffix hardening typically converts the fricative into a glottalized glide, whereas clitic hardening inserts a glottal stop. There is a special morphophonemic rule that the λ of the momentaneous aspect (3.1.5) under hardening always becomes ʔ instead of $\text{ʔ}\lambda$.

A “softening” suffix causes the preceding segment to become deglottalized, which converts ejectives to plain stops, weakens fricatives to glides, and otherwise inserts a glottal stop. Nuuchahnulth only has suffix (and not clitic) softening.

Following Werle (2010), I use ! to represent hardening, and ° to represent softening, across both clitics and suffixes. The ! notation was first introduced by Boas (1947), and ° by Jacobsen (1996). Like Werle, I abandon Sapir's use of ' and ' for mutations, and use the same symbols for both suffix and clitic mutations. Examples of all three types of suffix and clitic hardening and softening are shown in (254–256).

ʔapwín náas

gather.together-indoors.DR=FUT=STRG.1PL finish.MO=NOW=PSSB.3 half day

'Let's get together at midday.' (N, Fidelia Haiyupis)

Nuuchahnulth also has vowels that may be long or short depending on where they fall in the word. These vowels are long in the first two syllables of a word, and short in the third syllable or later. Following the established system in Wakashan studies, I represent these syllables in the morpheme line as the vowel followed by a °.¹ Both long and short realizations of variable-length vowels are shown for the ending =*ma°* in (257, 258).

¹This innovation is thanks to Rose 1981, who amended Sapir & Swadesh 1939's more cumbersome °

(257) ʔaʎiičiʔaʎma ʔaʎii.

ʔaʎa-i·čiʎ=!aʎ=ma· ʔaʎii

two-IN=NOW=REAL.3 road

‘There are two roads (now).’ (B, Bob Mundy)

(258) ʎuʎmaa ʕuʂukʔi.

ʎuʎ=ma· ʕuʂuk=ʔi·

good=REAL.3 new=ART

‘The new one is nice.’ (B, Bob Mundy)

Many affixes in Nuuchahnulth have a leading consonant that regularly disappears under certain phonological conditions, typically when preceded by a non-nasal consonant. Again, following the established literature in South Wakashan and first introduced by Sapir, I write these disappearing consonants in parentheses. Both realizations for the suffix *-L.(č)ilʔ* are shown in (259, 260).

(259) ʔaaqičilk ʎaacsɑ.

ʔaqi-L.(č)ilʔ=k ʎaacsɑ

ʕuʔikwiʎ³=s sut-L.(č)ilʔ

give.medicine.MO=STRG.1SG 2SG-do.to

‘I’m giving you medicine.’ (C, *tupaat* Julia Lucas)

Some of these disappearing consonants change based on their environment. A *č* regularly becomes a *k* after a *u*. This correspondence is not shown. Which consonants of an affix are disappearing also

³The momentaneous ending is typically *-kwiʎ* after *u*, *-čiʎ* after other vowels and nasals, and *-šiʎ* after other consonants. This is a rare instance of *-kwiʎ* occurring after something other than a *u*, and might be an indication that there was a *u* here in an earlier stage of the language.

changes dialect-to-dialect. I have attempted to segment disappearing consonants as appropriate for each dialect.⁴

B.2 *Template notation*

Nuuchahnulth has a set of vowel length and reduplication templates, typically triggered by a suffix containing segmental phonology. These templates specify reduplication and vowel length of up to the first two syllables of the word. I gloss these templates with the symbols *L*, *S*, *R*, and *R2*, attached to the suffix which triggers the template. There are two exceptions to the general rule that templatic morphology is associated with segmental phonology. The first is the graduative aspect, which I gloss as though it were an aspect suffix consisting only of the template. The other is certain kinds of plurals, which may consist of only reduplication or lengthening. I gloss these as prefixes consisting of only the templatic information.

In my notation, *L* and *S* indicate *Long* and *Short* vowels, and are ordered with respect to their occurrence: *LS* for a long first vowel and a short second vowel, *SS* for two short vowels, and so on. *R* indicates an onset-nucleus reduplication pattern, and *R2* a pattern that is onset-nucleus for polysyllabic roots, and full reduplication for monosyllabic roots. *R2* is a pattern that only occurs with the iterative and repetitive aspects, and a limited number of plurals. Vowel length is specified prior to reduplication. *LR* means a long reduplicant (followed by a vowel whose length is unaltered), and *RL* means a reduplicant followed by a lengthened base. If multiple templates apply, the vowel length specifications of the final morpheme win out, and reduplication remains. Table B.1 gives a list of most types of templates found in the language, including an example of the two patterns for the *R2* template.

⁴Notably, my consultant Julia Lucas fairly consistently pronounces the /q/ in the linker suffix -(q)h. I still transcribe the suffix in the segmentation line with the parentheses, as she sometimes fails to produce the /q/ when attached to quantifiers.

Table B.1: List of Lexical Suffix Templates

template	gloss	surface form
L	ču-L.ʔatu dive-sink.into.water	čuʔatu dive down into water

B.3 Grams

B.3.1 Aspect

In my glosses, I use the older and more conservative and traditional categorization of aspect, although there is a reanalysis of the system that I accept (§3.1.5). The table below is adapted from a system I helped Adam Werle devise. I use his grams for the conservative names of the aspects. There is a straightforward collapse from the conservative aspect system to the (hypothesized) revised aspect system, which I include in the table. By using the most conservative glossing I avoid losing information. Although not traditionally considered aspect, I include in the table the resultative morpheme, which,

when used, occurs in lieu of aspect.

Table B.2: Aspects in Nuuchahnulth

revised analysis	conservative analysis	gram	forms
perfective	momentaneous	MO	-č'íł̃, -š'íł̃, -k'w'íł̃, -uł̃
	inceptive	IN	- ^o ač'íł̃, -i'č'íł̃
durative	durative	DR	-(ʔ)ak, -(ʔ)uk, -L.hi'
continuative	continuative	CV	-(y)a'
gradulative	gradulative	GR	-LS
repetitive	repetitive	RP	-LR ₂ L.a
iterative	iterative	IT	-R ₂ .č̣, -R ₂ .ṣ̌
resultative	resultative	RS	-yu', -ču'

As discussed in (§3.1.5), these aspects can be divided into perfective and imperfective categories. Verbs ending in momentaneous or inceptive aspect are perfective, while the rest are imperfective. The durative and continuative aspect are weakly differentiated, and plausibly there is a supertype, continuous, that subsumes both. In Werle's notation, this is CT. To avoid confusion between “continuous” and “continuative,” I have assigned every morpheme either continuative or durative aspect, and avoided the underspecified continuous.

B.3.2 Mood

The category traditionally called “Mood” in Nuuchahnulth is not the same as “mood” as usually used by linguists, which stands in opposition to aspect and tense. Instead, Nuuchahnulth “mood” is a morphological category that fuses mood and evidential information with subject person and number, as well as containing other propositional information (such as interrogative and imperative marking). These moods can be split into matrix clause moods, dependent clause moods, and commands. Commands are special matrix clause moods that contain object agreement, when all other moods only contain subject agreement. Table B.3 gives a list of the moods, their abbreviations, and their third person forms. For commands, I list second person singular forms without an object, or a third person object, as third person agreement is null.

The meanings of these moods are mostly but not entirely consistent across dialects. The strong mood and real mood have the same meaning: a strong claim to reality, with the real mood used in the Barkley Sound dialect and the strong mood used in the Central and Northern dialects. The strong mood is in free variation in the Kyuquot-Checlesht dialect with the weak mood, which has come to be used as a matrix clause mood.

Table B.3: Mood Enclitics

name	gram	third person
Matrix Moods		
real	REAL	<i>=ma'</i>
strong	STRG	<i>=ʔi's</i>
neutral	NEUT	<i>=∅</i> ⁵
question	QUES	<i>=ha'</i>
hearsay	HRSY	<i>=we'ʔin, =wa'ʔi's</i>
inferential	INFR	<i>=ča'ʔaš</i>
dubitative	DUBT	<i>=qa'ča</i>
Dependent Moods		
weak	WEAK	<i>=(y)ii</i>
definite	DEFN	<i>=ʔi'tq</i>
possible	PSSB	<i>=quu</i>
dubitative formative	UNK1	<i>=(w)uus</i>
dubitative relative	UNK2	<i>=(w)uusi</i>
embedded	EMBD	<i>=qa'</i>
purposive	PURP	<i>=!eeʔita, =!aaʔi</i>
article ⁶	ARTL	<i>=ʔi'</i>
hearsay article	ARTH	<i>=ča</i>
Command Moods		
command	CMMD	<i>=!i'</i>
'go' command	CMGO	<i>=či'</i>
'come' command	CMCM	<i>=!i'k</i>
future command	CMFU	<i>=!im</i>

⁵Although the third person neutral is null-marked, the first and second person neutral mood forms are non-null. In the IGT, I do not actually gloss third-person neutral with a \emptyset , out of an aversion to inserting unpronounced items into an analysis, and due to the fact that my implemented grammar does not make use of null-marked elements in the gloss line.

⁶The article in Nuuchahnulth is also part of the mood complex, occupying the same morphological position and com-

Typically a clause can have only one mood ending, although there are some exceptions: the possible mood in the third person can be followed by the hearsay, yielding a matrix mood meaning something like ‘what is typically done, so I hear’, and the hearsay mood can be followed by the dubitative.

B.3.3 Other Clause-Bound Morphemes

Other clause-bound morphemes that occur in the second-position enclitic complex (3.1.3) include tense (and some related notions) and valence-changing morphemes.

Table B.4: Tense, Valence-Changing, and Other Clause-Bound Morphemes

meaning	gram	morph
now	NOW	=!a λ
future	FUT	=?aaq λ , =!aaq λ
past	PST	=mit
habitual	HAB	=?aata
plural ⁷	PL	=?at
causative	CAUS	=!ap
passive ⁸	PASS	=!at
possessive	POSS	=?ak, =uk

The “now” morpheme (NOW) should not be understood as a simple present, as it is often used in conjunction with the past and future tense, and can occur in a sentence that takes place at any time. It indicates that an event is occurring in a sequence, or that the current clause is the next event in a progression.

plementary with the other moods. More on this can be found in Inman (2018).

⁷This plural is separate from the plural that occurs as part of the mood portmanteaus, and may refer to the plurality of the subject or object of the verb. It is the only way to express the plurality of a dropped third person subject.

⁸The passive morpheme is also used for inalienable possession and generic statements. I do not gloss it differently according to its use.

B.3.4 Predicate-Bound Morphemes

The linker, and what I call the root-maker or stem formative are suffixes bound to the predicate. The linker is described in detail in Chapter 5. The stem formative *-q* (STEM) is used to create a bound root from a free word so that certain affixes can attach. Examples are *saantiquwit* ‘church’, from the word *saanti* ‘Sunday’ + *-uwit* ‘indoor room’. There is also *himwičaqyak* ‘myth’, from *himwiča* ‘myth telling’ + *-yak* ‘instrument, device for’.

Although it is restricted to verbs (unlike the linker and the stem formative), I include the reflexive *-stat* in this category.

Table B.5: Predicate-Bound Morphemes

meaning	gram	morph
linker	LINK	-(<i>q</i>) <i>h</i>
root-maker	STEM	- <i>q</i>
reflexive	REFL	- <i>stat</i>

B.3.5 Augmentative and Diminutive

Nuuchahnulth has two augmentatives and at least two diminutives. The *-(q)aq* augmentative more straightforwardly means ‘big’ while the *-sa* augmentative has a broader augmentative meaning, including ‘real’, ‘true’, and ‘very’. I give the more common *-sa* the AUG1 label. The diminutives have no appreciable difference in meaning, so I gloss both as DIM.

Table B.6: Augmentative and Diminutive

meaning	gram	morph
augmentative (“real”)	AUG1	- <i>LS.sa</i>
augmentative (“big”)	AUG2	- <i>SS.(q)aq</i>
diminutive	DIM	⟨ <i>čk</i> ⟩, - <i>ʔis</i>

B.3.6 Semantically Empty Roots

Many suffixes in Nuuchahnulth contain complex semantic content, and often attach to semantically light or meaningless roots. Two semantically contentless roots are used in such cases: *hita-/hina-* and *ʔu-*.

The root *ʔu-* is used in place of an object for transitive suffixes to attach to. Many transitive verbs in Nuuchahnulth are suffixes that may attach to the first syntactic word of their direct object (§3.1.4.1). In lieu of attaching to their object, these suffixes may attach to semantically empty *ʔu-* instead. After attaching to *ʔu-*, the direct object of the verb may be expressed as a separate word, or dropped altogether. Because of its nature as a “placeholder” for a syntactic object, I chose x as the gloss for this morpheme.

- (261) *ʕumtnaak*
 ʕumt-naʔk
 name-have
 ‘having a name’

- (262) *ʔunaak ʕumt-ii*
 ʔu-naʔk ʕumt-iʔ
 x-have name-NMLZ
 ‘having a name’

The roots *hita-/hina-*⁹ are more unpredictable in their distribution. They tend to be a place of attachment for location suffixes (§3.1.4.3), although occasionally other suffixes can attach to them.¹⁰ To distinguish these grams from *ʔu-* x, I gloss this root as *EMPTY*, as can be seen in (263, 264).

⁹There appears to be no way to predict whether *hita-* or *hina-* is used for a particular word, although there is a clear phonological resemblance.

¹⁰An example is *hiniic* ‘carry’, *hina-iic*. The suffix *-iic* can also attach to *ʔu-*, *ʔuuc* ‘carry’.

- (263) *hitaqsiĭ*
 hita-qsiĭ
 EMPTY-in.a.vessel.MO
 ‘enter into a vessel’

- (264) *hinulta*
 hina-ul̥ta
 EMPTY-out.of.canoe
 ‘get out of the canoe’

Table B.7: Semantically Empty Roots

meaning	gram	morph
—	EMPTY	<i>hita, hina</i>
—	X	<i>ʔu</i>

B.3.7 Deictics

Nuuchahnulth dialects each have a set of demonstrative deictics. In the Central, Northern, and Kyuquot-Checlesht dialects there are six: four locative deictics and two non-locative deictics. The Barkley dialect only has the one topical deictic, and so has five altogether. For the locative deictics I use a numbering scheme 1-4, with 1 being the closest and 4 the furthest away. For the shared topical deictic I use *DTOP*, and *DDYN* for the topical ‘this.’ This distinction among deictics originates from Adam Werle. I use the Central deictics to demonstrate my glossing schema below.

Table B.8: Deictics, Central Dialect

meaning	gram	morph
this	D1	<i>ʔaḥkuu</i>
that by you	D2	<i>ʔaḥṇii</i>
that	D3	<i>ḥaaʔaḥi</i>
that (far)	D4	<i>ḥuuʔaḥi</i>
this (dynamic)	DDYN	<i>ḥiʔaḥi</i>
that (topical)	DTOP	<i>ʔaḥʔaa</i>

Appendix C

ADDITIONAL DATA

C.1 Forced choice test for perfectivity matching

In §4.2.1.1, I reference an attempt at forced choice to bring out any preference for perfectivity marking. For this, I worked with 5 speakers but I worked with Bob Mundy and Marjorie Touchie at the same time, and so report their preferences together. The results on the perfectivity component of this test was mixed, as seen in Table C.1.

Table C.1

Test number	Forced choice (Central version)	Perfectivity	Total	SB	FH	JL	BM+MT
Case 1	1 ?uucu?ukits mataa paastin?ath	match (imperfect)	1				1
	2 ?ucačiłits maatuk paastin?ath	mismatch	1	1			
	neither		2		1	1	
Case 2	1 yaacukwıtass ?ucačił ɬa?uk?i	mismatch	2	1			1
	2 yaacukwıtass ?uucu?uk ɬa?uk?i	match (imperfect)					
	neither		2		1	1	
Case 3	1 λiıłşıłwıtass ?ucačił ɬa?uk?i	match (perfect)	1		1		
	2 λiıłşıłwıtass ?uucu?uk ɬa?uk?i	mismatch	0.5				0.5 ¹
	neither		1			1	

There is no clear pattern from this data, and if anything it suggests there is no preference for perfectivity matching. This appears to contradict the data from §4.2.1.1. I believe there are a few possible explanations for this.

The first is the peculiarities of the speech of Checlesht speaker Sophie Billy (marked as SB in Table C.1). I had noticed prior to running this test that in one-on-one sessions she was more willing to

¹I used a slightly different example, but Marjorie and Bob agreed to the mismatching verb. Then when asked to repeat it, they both gave their own example sentences using different verbs.

accept perfectivity mismatching than other speakers, and she preferred the mismatching verbs in both cases she addressed.

The second was provided by Marjorie Touchie, who along with Bob Mundy represents the other cases where a speaker preferred mismatched perfectivity. Marjorie articulated her preference by saying “It says you haven’t arrived yet, you’re on your way.” The perfectivity of the entire action was interpreted, for her, on the verb of going (*ʔucačič* or *ʔuucuʔuk*) and not the verb describing manner (*yaacuk* ‘walking’). This appears to be a change from what is present in the Nootka Texts (§4.2.1.1), and if I take this intuition seriously it may explain why perfectivity mismatching does occur in the modern language sometimes. Despite this preference, Bob and Marjorie would then go on later to give alternative ways of expressing Cases 2 and 3 that avoided coordinating these verbs. Julia Lucas refused all my examples and came up with her own sentences which used different grammatical structures. Fidelia Haiyupis either rejected examples and avoided serialization, or preferred matching aspect. Fidelia would puzzle over these for a while, and then produce alternative example sentences, always with matching aspect. So while straight speaker responses show that perfectivity mismatching is not a requirement, the context of speaker answers, as well as corpus counting (Table 4.1) shows that there is still a preference for it, although it is weaker than what appears to have been the case for the Nootka Texts.
